09		SHIP IT LIKE YOU SHOW UP
10		THE TEAM IS THE TOOL
11		STRONG ENOUGH TO LISTEN
12		THE WEIGHT IS REAL. OWN IT.
13		AI IS THE NEW OS. THE MISSION IS THE ONLY APP THAT MATTERS.
14	CONCLUSION	CONCLUSION: GIVING A SHIT WORKS

A NOTE ON THE SECOND EDITION

If you read the first edition of *Mission Built*, or an early copy of this one, welcome back. A few things changed.

Most visibly, the second edition adds a chapter: Chapter 13, *AI Is the New OS. The Mission Is the Only App That Matters*. It exists because 2026 forced the question. AI raised the floor of average work in a way no tool ever has, and the book's central argument, that mission, reps, feedback, recovery, and ownership are what produce real strength, needed to be tested against the loudest tool of the year. So I tested it, twice: once under the bar and once in the boardroom.

You'll notice a few other additions. The Drift, named once in the first edition, now recurs as a deliberate framework: Boeing's Drift in Chapter 1, the recovery-shaped Drift in Chapter 6, the legacy-shaped Drift in Chapter 12, and the AI-shaped Drift in Chapter 13. Three appearances of an idea is when it becomes a reader's framework, and four is when it becomes the spine of how you think about work.

The give-a-shit motto now has its source on the page. It belongs to Marine squadron VMM-364, the Purple Foxes, CASEVAC pilots who fly into enemy fire to bring wounded troops home, and it is three words on their patch. The motto came to me through Nate Fick at Endgame, and it has been the working motto of my career.

Some examples are paired with updates from 2024 to 2026: Boeing's 737 MAX now sits next to the 2024 Alaska Airlines door plug, and Cyberpunk 2077 next to the Humane AI Pin. The principle holds, and the evidence is current.

The second edition also got a rep it needed. The first version went out with prose that had been edited into fragments, and readers who know how I talk noticed. This revision restores the voice. The argument, the stories, and the sources did not change.

What didn't change is the mission and the give-a-shit. The voice is back where it belongs. Those are the work.

– Mike

WHO I WROTE THIS FOR

This book is for anyone who builds things: GMs and PMs trying to figure out what matters most, engineers who want to know why the work is what it is, designers who care more about the user than the demo, and leaders trying to lead instead of manage.

If you spend your days deciding what to ship and how, this book is for you. It is not a methodology, and it is not a framework you have to adopt. It is a field guide for the why beneath the what, for the principles that hold when the deadline shifts, the strategy changes, the tooling evolves, and the team turns over.

I am also a powerlifter and a coach, and I have spent more than a decade under the bar. I lean on that world throughout this book, but not because I expect you to lift. The gym is one of the cleanest mirrors I know for the work we actually do in product: honest input, reps that matter, and systems tested under load. The bar is just the example, and the principle is the point.

It's also a leadership book, in the way the best leadership books are: a collection of specific stories about what actually mattered when the work got hard, at Endgame, at Elastic Security, in the military, under the barbell, and on the floor of the CAOC at Nellis. These are lived examples, not borrowed wisdom.

Most of all, this is a book about empathy. That word has gotten lighter than it should be. We live in a time when caring for others gets called weak, when standing up for someone besides yourself gets called foolish, and when the loudest voices argue that strength is what you take and softness is what you give away.

I disagree, and I have spent my whole career proving the opposite: in uniform, defending networks, building products, and coaching lifters. It has been the same lesson every time. Real strength is what you give. The mission lives in the people next to you, and the user is on the other end of every decision. Empathy

isn't softness. It's clarity. It's what makes the work worth doing in the first place.

If that resonates with you, this book is for you. If it doesn't, I hope it changes your mind.

– Mike

BUILT FOR MORE

July 2016. The Combined Air Operations Center at Nellis Air Force Base. Red Flag is about to begin. My engineering lead and I are standing silent on the floor, and our agent is deployed on systems across the room. Pilots are about to be in the air, controllers will guide them, and air defense will track them. A crashed laptop in a startup is annoying. A crashed laptop here is a different category of problem entirely.

We had bet the company on this moment: six months of rebuilding every layer of the product, from the front end language to the agent communication to the back end architecture. Six months of late nights, early mornings, and days that bled together. Six months of couches, conference room floors, and pizza at 2 a.m., for one customer, in one room, on one exercise we could not afford to fail.

That moment is what this book is about. Before the titles, before the roadmap and the metrics and the barbell plates neatly stacked on a rack, there was the mission.

I've worn uniforms and hoodies, sat in war rooms and boardrooms. I've served with soldiers and shipped with engineers. And the one thing that always stood out, the one thing that always worked, was giving a shit. About the work. About the people. About the outcome.

That motto belongs to VMM-364, the Purple Foxes, a Marine tiltrotor squadron whose pilots fly CASEVAC into enemy fire to bring wounded troops home. It is three words on their patch, and they have run my life ever since. You will meet them in their full weight in the chapter on AI.

This isn't a memoir, and it's not a manual. It's a field guide for anyone trying to build something that lasts, whether that's a body, a product, a company, or a life with integrity. You won't find shortcuts here, just reps, principles, and stories from the weight

room and the war room, forged in pressure and refined in reflection.

Real strength doesn't come from just lifting the weight. It comes from knowing why you're lifting it.

Now, let's get to work.

– Mike

■■■ CHAPTER 01

01

MISSION BEFORE METRICS

THE MISSION IS THE MAGNET

CHAPTER 01 • SECTION 1.1

Before I ever built products, I served in the U.S. Army as an Airborne intelligence sergeant. That experience of working in service of something larger than myself, of making decisions under pressure with lives on the line, shaped everything that came after. I learned early that the mission comes first, ahead of ego and ahead of recognition, and I have never found a reason to unlearn it.

That mindset followed me from the military into cybersecurity, and then into leadership roles where the stakes changed but the values stayed the same. Whether I was securing critical systems, helping build Elastic Security, or coaching in the gym, the goal has always been the same: real strength is lifting others.

One of the proudest chapters of my product career was building Endgame. We entered a brutally competitive market, going head to head with massive players like McAfee and CrowdStrike, and we carved out real ground. We didn't win because we had more money or brand recognition. We won because we had something harder to copy, a clear mission: protect high-value targets from nation-state level attacks. That focus, and the small, fierce team who rallied behind it, made all the difference.

At the heart of it was Nate Fick, a Marine officer turned tech CEO, and later the U.S. Ambassador for Cyberspace and Digital Policy. He led with conviction, clarity, and a deep respect for the mission. In all-hands meetings, Nate would remind us that we were an “elevator asset company,” meaning that if the building burned down, the most important assets could still fit in the elevator. He did not mean the code or the tools. He meant the people, the ones who understood the user's mission and had the passion to serve it.

That idea stuck with me. Nate's example reinforced what I had learned in uniform: the success is the user's success, and your mission is their mission.

Nate also brought something else with him out of uniform, a motto from the Marines. Three words from the patch of VMM-364, the *Purple Foxes*, a tiltrotor squadron whose pilots fly CASEVAC into enemy fire to bring wounded troops home. *Give a shit*. About the work. About the people. About the outcome. It became the working motto of my career, and it has been the spine of everything I have built since. I'll come back to it in full when we get to the chapter on AI.

Metrics are the outcome of making your user successful. Yes, we need to measure them. But they are the result of serving the mission, not the reason for it.

There's a moment in every product meeting when the question slides in like it always does: "*How will we measure success?*" It's a good question, just not always a good first question.

In lifting it's the same story. People chase PRs every week like the number on the barbell is the whole point, so they add five pounds, hit record, post the clip, and do it again the next week until something gives. Metrics without a mission are just noise, pressure with no direction behind it and goals with no guts. The weight on the bar isn't the goal, it's the evidence of progress, not the destination.

We've all seen what happens when this mindset takes over, and it is not a failure of talent so much as a failure of alignment. *Cyberpunk 2077* didn't initially flop because the devs didn't care. Far from it. The development team poured years into building something ambitious, but the pressure to hit a holiday launch window, a decision made at the executive level, overrode the mission of delivering a complete, polished experience. The result was a rocky release, millions in refunds, a reputational hit, and a stock crash.

To their credit, the team stuck with it. Years later, after patches and a reimagined DLC, the game has earned back much of the trust it lost, which is what happens when talented people are finally given the space to do the work right.

But not every team gets the chance to earn trust back. Humane raised over \$230 million to ship the AI Pin in April 2024, a wearable that was supposed to replace your phone with voice and laser projection. The reviews were brutal: battery life, overheating, latency, hallucinations. The mission of building something a user actually wanted got buried under the mission of shipping what investors had already paid for. Less than a year later, HP bought the company's IP for a fraction of its peak valuation and shut down the servers, and every Pin in the wild became a brick on the same day. There was no mission left to recover.

And we've seen what it looks like to protect the mission, even when it means stepping back. Simone Biles did exactly that in front of the entire world at the 2021 Olympics. Under unimaginable pressure, she chose long-term purpose over short-term performance. She knew something was off, and she honored that instinct.

"I have to focus on my mental health... if you don't, then you're not going to enjoy your score and you're not gonna succeed as much as you want to." — Simone Biles

Her move wasn't retreat, it was leadership. And in time she returned to competition stronger, on her terms, and more respected than ever: a different kind of comeback, powered by mission rather than metrics. Success is not about hitting every metric, it is about refusing to lose yourself trying.

MORE THAN JUST GOOD INTENTIONS

Being mission-driven is not a poster in the break room or a bullet in a pitch deck. It is how you move, how you decide, and how you

show up when it's hard.

Velocity gets celebrated, the launch that went out and the number that went up this week. Mission is quieter than that, but quiet doesn't make it weak. Mission gives you clarity when things get blurry and stamina when things get hard.

Patagonia famously ran a campaign telling customers not to buy their jacket unless they truly needed it. SpaceX targets goals across decades, not quarters. Mission alignment shows up in the timelines a company is willing to commit to, and it pays off: research shows people who believe in the purpose behind their work stay longer, burn out less, and deliver more.

WHEN METRICS ECLIPSE MEANING

Metrics matter, and I am not arguing against measurement. They matter when they serve the mission, though, not when they become it. Here is where teams lose the plot:

- They ship fast instead of shipping right.
- They chase signups instead of learning why users leave.
- They brag about launches and ignore long-term usage.

When dates drive development, teams start cutting corners. Feedback loops close, energy fades, and you build momentum toward a number instead of toward value. In the gym this is ego lifting, and in product it's just as risky. It looks like burned-out engineers, brittle systems, and growth that collapses the second you stop pushing it uphill.

THE FULFILLMENT FLYWHEEL (POWERED BY PURPOSE)

There's a better model, and it's as relevant in combat as it is in code or in the squat rack. It's called the OODA Loop: Observe, Orient, Decide, Act. It was developed for fighter pilots and adopted by startups, and it runs on clarity.

Without a clear mission, the whole loop spins out. With a mission, observation knows what matters, orientation filters cleanly, decisions line up with the work, and action carries resolve.

Without one, you collect noise, over-prioritize the wrong metrics, chase vanity wins, and execute half-heartedly. In lifting, that means trusting the plan instead of maxing out because you feel good that day. In product, it means waiting to ship because your users aren't ready, even if your OKRs are.

Mission turns chaos into clarity: it makes every rep count, every release matter, and every decision directional. This is the real flywheel of fulfillment: mission fuels clarity, clarity powers resilience, resilience drives real progress, and real progress reinforces the mission. That's the through-line, and it's what keeps us going. Metrics follow. The mission leads.

THE DRIFT

CHAPTER 01 · SECTION 1.2

At first the metric is a mirror. It reflects the mission cleanly, and for a while it stays true. But over time something shifts, quietly and gradually enough that nobody calls it out, and the mirror warps. Without noticing, we start steering toward the reflection instead of the road. That is the Drift.

It doesn't announce itself, and it rarely arrives with bad intent. It begins with a goal:

- Launch the feature by Q4.
- Hit 405 on deadlift.
- Increase MAUs by 20%.

Reasonable, measurable and specific: these are the numbers we hold up as evidence that we're making progress, and for a while, they are. But then the goal becomes the game.

In product we've seen it time and time again. Shipping becomes more important than solving. Teams crunch to meet a date set quarters ago, long after the user problem has evolved. The metrics start chasing headlines, because investors want news and executives want motion, and the dashboard glows green while user trust fades red.

Think of Boeing. In the race to beat Airbus, they needed the 737 Max on runways fast. Shareholder pressure mounted and deadlines became immovable. On paper the metrics looked great, deliveries met and costs controlled, but beneath the numbers, safety systems were skipped and warnings dismissed. Two crashes and hundreds of lives lost. The drift wasn't just technical, it was cultural: speed overtook scrutiny, and the metric overtook the mission.

The hard part is that the Drift does not heal on its own. In January 2024, a 737 MAX 9 lost a door plug at 16,000 feet on Alaska Airlines flight 1282. No one died, but only because the seats next to the missing door were unoccupied. The plug had been reinstalled at the factory without the four bolts that were supposed to hold it in place. Same company, same speed-versus-scrutiny pressure, and eight years after the first MCAS crash the cultural drift was still doing its work. The Drift, once it sets in, takes a generation to clear.

In strength, the signs are physical, and brutal. Hafthor Björnsson, one of the strongest men in history, returned to powerlifting after two years of boxing and set his sights on breaking the raw total world record. Big lifts were stacking fast, but recovery lagged behind. He felt the warning signs, the tightness and the fatigue, and he kept pushing. He wasn't recovering between sessions and, as he later admitted, he wasn't listening to his body. Then came the snap. Attempting a 556-pound bench press, his pec tore clean off the bone.

The Drift had found him too. Progress had come loose from process, and recovery had been sacrificed to reach a number that no longer served the mission. The result was pain, delay, and a lesson carved in scar tissue.

The damage isn't just physical, it's psychological, because when we treat metrics as the mission, missing them feels like failure. So we hide the truth, inflate success, or worst of all, stop trying. The Drift corrodes not through force but through inversion: it flips process into performance, it turns care into compliance, and it burns people out.

I've worked with brilliant people who could have built anything, and they left, not because they failed but because the system stopped valuing why they showed up in the first place. When we reduce contribution to a dashboard, we forget the soul behind the keyboard.

Research shows mission-driven employees are significantly more loyal. A LinkedIn survey found mission-motivated employees were 54% more likely to stay with their company for five or more years, and companies with purpose-driven programs saw 52% lower turnover among newer employees.

So what's the antidote? Not to ignore metrics, but to anchor them: use them as signal, not steering, and build systems that reinforce why we do the work. The real goal isn't a launch date or a deadlift. It's built through the reps, not measured by them.

REPETITION WITH INTENTION

CHAPTER 01 · SECTION 1.3

You don't get strong by lifting heavy once. You get strong by showing up again, and again, and again. But if you do the same thing forever, you don't get stronger, you get stuck. That's the tension of progress: it demands ritual, but it punishes repetition without variation.

Whether in the gym or in product, growth comes through iteration, small and deliberate cycles of effort. You log your training, you tweak your form, you try a new tempo. In software, you ship, you measure, you talk to the user, and you try again. The process isn't glamorous, but it is generative.

Rituals compound. Rules confine. A rule says *"do this."* A ritual says *"do this because it matters."* One is brittle and the other bends with you.

Agile isn't magic, it's a set of rituals: standups, retros, demos, sprints. They only work when they're anchored in meaning and adapted to context. Treat retros like checkbox theater and you're looping, not iterating, and if your standup sounds like *"I did stuff, I'll do stuff, no blockers,"* you've got a ritual without a reason.

The same failure shows up in the gym. People find a powerlifting program online and follow it to the letter, even when it doesn't fit their recovery, their age, their job, or their life, and then they wonder why they plateau or get hurt. It's because they forgot the principle beneath the plan. That's where most systems fail: not because the framework is flawed, but because the user is forgotten, treated like an input to a method instead of the reason for its existence.

Let's be honest: there's no shortage of books telling you how to do things, and yes, here we are, writing another one. But this isn't a blueprint, it's a philosophy, and the implementation is on you.

What works for one team, one lifter, one body, won't work for another, and that's not failure, that's reality.

Stefi Cohen didn't become a record-breaking lifter by blindly following a single powerlifting template. Her training evolved through experimentation: strength phases, hypertrophy cycles, hybrid athletic blocks. She didn't just lift heavy. She studied her feedback, varied her stimuli, and rewrote her rituals to fit her mission. Progress didn't come from rigidity, it came from rhythm and reinvention.

In product, that same spirit of experimentation lives in hack weeks, short and sacred breaks from routine where teams can stretch in new directions. Atlassian, Spotify, and Elastic have all embraced this. At Elastic, hack weeks became a celebrated ritual, and not just for innovation but for joy. Some of Elastic Security's most creative features were born not in sprint planning but in that carved-out chaos. Sometimes the best way to realign with the mission is to deliberately step outside it.

Rituals work when they're shaped by the user, not imposed on them, they're tools, not commandments. And when they're working, you feel it, not just in output but in outlook. A team that trusts its rituals doesn't need micromanagement, and a lifter who trusts their program doesn't need motivation hacks. The rhythm carries you and the meaning sustains you.

None of this means rituals are static. They have to flex to your fatigue and bend to your bandwidth, and they have to evolve, not just to avoid boredom but to stay honest with the mission. Same input, same outcome. If the goal has changed, so must the reps. That's what separates the lifter who grows from the one who stalls, and the product team that adapts from the one that burns out.

If the mission is the magnet, rituals are the rails. They don't tell you where to go, they keep you from sliding off the path while you find it. Rituals give you direction, but progress comes from the work itself: the grind, the reps, the effort no one applauds.

■■■ CHAPTER 02

02

BUILT THROUGH REPS

THE MYTH OF OVERNIGHT SUCCESS

CHAPTER 02 • SECTION 2.1

We’ve all heard the stories: the product that “took off overnight,” the lifter who casually pulls four plates like they’ve always been able to, the founder in a garage who changes the world with a single keynote. It’s tempting to believe that mastery happens like that, in a flash, but that’s not really how it works.

Take the iPhone. The 2007 reveal made it feel like it dropped from the sky fully formed, and behind that moment were years of trial and error: touchscreens that didn’t quite work, software that crashed mid-demo, a mountain of prototypes that never saw the light of day. The final product wasn’t a stroke of brilliance so much as relentless iteration.

Same with Instagram. What looked like an overnight success was actually the second version of a too-close-to-Foursquare check-in app called Burbn, and the team just kept listening, trimming, and trying again, one update at a time.

Or Cursor. The AI coding tool that seemed to dominate developer feeds in 2024 was the second product from Anysphere, a small team that had spent the previous two years pivoting from a different idea entirely. The “overnight” moment was years of quiet work on a forked IDE before anyone outside the team noticed.

That’s a story I’ve lived from the inside. In July 2016 at Endgame, we shipped a product into a live Air Force exercise after six months of rewriting every layer of the platform: we moved the front end to a new language, rewrote how the agent talked to the platform, and redesigned the back end, all of it for one customer in one room, on one exercise we could not afford to miss. The press release made it look clean. The reality was conference room

floors, 2 a.m. pizza, and a team that never went home. Polish hides process. I'll tell the story of that exercise properly in the chapter on shipping, because that is where the shipping part belongs. The grind that built it belongs here.

And that big deadlift on your feed? Probably not magic either. More likely it was a hundred quiet sessions, some of them rough, and a lot of small choices to show up, tweak form, and trust the program.

We love the idea of sparks: fast wins, big leaps, sudden breakthroughs. But progress usually doesn't feel like that. Most of the time it feels a lot more like repetition, the engineer fixing the same piece of code again, the founder rewriting their pitch for the fifth time, the lifter running the same warm-up cues every session no matter what's on the bar. It isn't flashy, but it adds up.

That's part of what makes the first few months, or the first year, so exhilarating. In the gym you make gains almost every week. In a startup your product evolves daily. Everything feels fast and the feedback is loud, and then you hit the plateau. The easy wins dry up, strength doesn't come as quickly, users get harder to surprise, and suddenly the game is no longer chasing sparks but showing up and pushing through. This is where the real work begins.

In lifting, that means grinding through the middle, not maxing out but mastering the basics under load. In product, it's the shift from scrappy innovation to enterprise-grade reliability, with less fanfare and more focus, and it's the part that actually defines mastery. The goal at this stage is not more weight or more features. It's honing your form: dialing in your brace, fixing a subtle shift in your squat, finally feeling your lats engage in a deadlift, or, in product, refining an initiative until it truly solves the right problem. Reps aren't just about volume, they're about attention, and attention is what makes progress sustainable.

REPETITION IS NOT REDUNDANCY

CHAPTER 02 • SECTION 2.2

Not all reps count the same. Anyone who's coasted through a gym session just moving weight knows the difference: one set burns time, and another builds awareness, precision, and strength even if the numbers on the bar don't change. The same split shows up in a sprint. Repetition isn't redundant when it's intentional, when you use it to test assumptions, refine interfaces, tune performance, or build something just a little closer to what users actually need. That's the kind of rep that moves things forward.

But repetition alone isn't enough, and variation is what makes repetition transformative. In strength training, that's where Renaissance Periodization's framework lives. Dr. Mike Israetel teaches a structured progression, Minimum Effective Volume (MEV), Maximum Adaptive Volume (MAV), and Maximum Recoverable Volume (MRV), that lets lifters build under load without burning out. The concept isn't about working hard so much as working smart, within boundaries that adapt to you.

In training we use blocks for different goals: hypertrophy to build muscle, strength to build expression, deloads to recover and grow. We manipulate movement, load, and tempo to avoid stagnation, so a paused bench press, a deficit deadlift, or chains added to a bar each target a different adaptation even though the base movement stays the same.

Product teams run on the same idea, whether or not they call it that. You might run a block of sprints to achieve a specific outcome, refining onboarding, improving performance, or tackling tech debt, and then shift into a new block with a new goal. Like training, it takes enough intention to complete a cycle, maybe one, two, or three sprints, before you vary the focus.

Progress comes not from flailing in every direction but from focused variation over time.

And just as strength doesn't grow without tension, product insight doesn't grow without diverse input. You can't loop with your own team forever. Sometimes you have to stretch and go talk to sales, to customers, to analysts, to skeptics, even when it's uncomfortable, and especially when it is. Frans Johansson's *Medici Effect* is built on exactly that principle: stepping into an intersection of fields, disciplines, or cultures lets you combine existing concepts into extraordinary new ideas. In the gym, that might mean lifting with people stronger or different than you. In product, it means bringing in voices from outside your echo chamber, the support calls, the sales objections, the person who almost churned.

Reps alone build endurance, and smart variation builds power. That is how you break through the plateau, not by abandoning the reps but by evolving them.

WHEN THE SPARK FADES

CHAPTER 02 • SECTION 2.3

The first reps are easy, not physically but emotionally. You're fired up, everything's new, and progress is loud and obvious. Then the rush wears off.

In lifting, it's the long middle. The early PRs stop coming, your form stalls, and you show up, grind through the same sets, and wonder if you're actually moving forward. You're not always chasing your one-rep max, and you shouldn't be. Strength isn't built by living at your limit. It's built in the space between peaks, when you train with intention and recover with discipline.

In product, the long middle looks the same. You can't always be doing the flashy, innovative thing, and sometimes the most important work is foundational: fixing backend debt, improving accessibility, tightening up performance, the kind of work that creates capacity for brilliance later. For a lot of people this is where the wheels come off, because motivation, that spark, is unreliable. It was never designed for the long haul and it doesn't care about your goals, which is why systems matter more than sparks.

Systems are how you keep showing up when the dopamine dies down: morning routines, logbooks, standups, progress reviews. They don't need to be rigid, but they do need to be real, because reps don't get done by accident. You don't need hype so much as you need structure. In training, that structure might be a coach, a program, or a calendar alert that says "*get under the bar.*" In product, it might be a rhythm of sprint planning, async demos, or check-ins with customers. Externalized accountability is often the only thing that keeps momentum moving.

James Clear, the author of *Atomic Habits*, put it about as plainly as it can be put:

“You do not rise to the level of your goals. You fall to the level of your systems.”

The work still has to be done, but when your environment supports your actions it gets done more often. The people who make the biggest progress aren't usually the most intense. They're the most consistent. They build when no one's watching. They train when it's not fun. They keep caring, even when the spark is gone.

But what if you need to find the spark again? One of the fastest ways to reignite your drive is to reconnect with the people you're building for. Talk to your users, especially the ones who aren't shouting. You might think the work you're doing isn't flashy, but somewhere out there someone is craving exactly what you're building. Stability, accessibility, visibility: those aren't buzzwords to users with real problems, they're lifelines. Find those users, listen to them, and let them lift you up, because nothing recharges momentum like hearing someone say, *“This made my day better.”*

THE MULTIPLIER OF BORING WORK

CHAPTER 02 • SECTION 2.4

There's a kind of work that doesn't make headlines. No one posts their warm-up sets, and no one celebrates shaving 100ms off load time, but that's the work that wins.

For every PR pulled in competition, there are hundreds of days of grinding behind it: submaximal sets, long pauses, light reps, mental resets. Product has the same hidden ledger. Every effortless-looking release rests on a foundation of something much deeper, months of planning, iteration, bug-fixing, and late-night Slack threads.

In lifting, it's the mobility work you do alone at 6 a.m., the back-off sets you don't skip, the deload week you take seriously. None of it looks impressive, but it makes everything else possible. In product, it's building out role-based access controls, not because it's exciting but because your biggest customers expect it. It's mapping audit logs across services so your platform isn't a compliance risk anymore. It's the 10th conversation with a user about the same rough edge in the UX. None of these are "big bets," but they're the reason your big bets land.

Boring work compounds. Each rep you don't skip, each ticket you don't shortcut, each problem you refine instead of avoid, stacks up quietly and relentlessly, and over time it becomes your edge. You don't need to go viral. You need to be trusted, and trust is built in the boring work: the warm-up that prevents injury, the small fix that prevents churn, the five-second improvement that gives a user five minutes back. What separates the strong from the strong enough is not what you do once but what you do without applause, for the growth, for the discipline, for the user whose day you quietly made better, and never for the accolades.

The new wrinkle, in 2026, is that AI can do some of the boring work for you. The release notes can be drafted, the audit log can be summarized, the user transcript can be tagged, and that is real and mostly good. But the reps that build *you* are not the ones a model can take. They are the ones you choose to show up for, and I'll have a lot more to say about that line in the chapter on AI.

What separates long-term success from short-term effort isn't glory but the passion to do the work for its own sake. The features and the gains are just symptoms. What matters is the mission that fuels them. It's a big part of why I'm so passionate about product management, and about lifting. The best PMs and the best lifters don't just show up for themselves. They show up for the team, for the user, and for their own growth, not in a selfish way but in a way that elevates everything and everyone around them.

And if you've made it this far, through the reps, the plateaus, and the quiet work, you already know this isn't just about shipping or lifting. It's about becoming the kind of person, or the kind of team, that keeps showing up. That is the real win, and it lives not at the peak but at the foundation.

THE WORK BECOMES THE WIN

CHAPTER 02 • SECTION 2.5

At some point the reps stop being something you have to do and become something you just do. You stop chasing motivation and start trusting momentum. You stop asking when it gets easy and start asking how to keep showing up.

That's the shift, and it isn't only in the gym or on your sprint board, it's in your mindset. You lift because you care. You build because it matters, because you love it. The PRs and the product launches were never the point. What they represent is the point, the hours you logged, the patterns you learned, the people you helped. That's what it means to be mission built. You're not doing it for the spotlight. You're doing it because you've seen the power of the process, and you're not walking away from it.

Progress doesn't shout. It stacks. One quiet rep at a time.

■■■ CHAPTER 03

03

RITUALS OVER RULES

THE RITUAL IS THE RAIL

CHAPTER 03 • SECTION 3.1

If the mission is the magnet, the ritual is the rail.

Rituals keep us on track, not by forcing us forward but by guiding our momentum. Like the rails under a train, they don't power the engine, but they make sure we're headed in the right direction, and they keep drift from becoming derailment.

In the gym, the rituals aren't written on the whiteboard, but everyone knows them: the way you chalk your hands before a heavy lift, the nod from your training partner, the slap on the back before a max attempt. None of those moments make you stronger by themselves, but they signal that it's time to lock in, and they tune your mind and body to the work ahead.

In product, rituals shape how we build and why. A startup begins with a weekly sync focused on shipping one differentiated capability. As the company grows, the rituals evolve into structured roadmap reviews, tighter standups, and a shift toward shipping the “boring” features like role-based access control and data retention workflows. RBAC and audit logging will never make the cover of TechCrunch, but they are what your biggest customers need before they can trust you. Those shifts aren't a loss of agility, they are a deepening of commitment, and the rituals grow because the mission does.

The difference between a rule and a ritual is intention. A rule is imposed on you, and it says “*follow this or else.*” A ritual is something you earned, and it says “*this is how we move with purpose.*” When a team stops asking why it follows a process, that process calcifies into dogma. When the process stays tied to the mission, it adapts, it grows, and it stays human.

Elite lifters know this instinctively. Their programming changes all the time, higher volume, lower intensity, a shift from

competition prep to recovery, but their rituals stay intact. The warmup flow, the music, the way they approach the bar all evolve, and none of them ever disappear. They guide the body into readiness and keep the lifter connected to something deeper than the day's numbers.

That's the point. You don't need more rules, you need rails that carry you toward the mission and flex with the turns ahead. The mission is the magnet and the ritual is the rail, and the rail is not there to restrict your path, it is there to keep you from drifting when the pressure builds.

LISTEN TO YOUR SIGNALS

CHAPTER 03 • SECTION 3.2

Rails only work if you are paying attention to where you are on them, and rituals are no different. You can't run the same program forever, not in the gym, not in product, and not in life. Progress demands feedback, and feedback starts with listening.

Lifters learn this early. You might show up ready to deadlift heavy, but your grip feels off, your back is tight, and your CNS just isn't firing. (CNS is your central nervous system, the part of your body responsible for strength output, coordination, and neural drive. If it is fatigued, you will feel it, even if your muscles are technically rested.) That is not failure, that is information. A smart lifter doesn't abandon the workout, they adjust. They keep the ritual and shift the intensity, maybe pausing at 70%, maybe pivoting to accessories. Listening like that doesn't make you weaker, it keeps you in the game longer.

Product teams learn the same lesson, usually the hard way: rituals without awareness become liabilities. You can run all the ceremonies, sprint planning, retros, standups, but if you are ignoring the signals from your team and your users, you are performing process theater. Burnout doesn't show up in Jira, and disengagement doesn't flash red on a dashboard. You feel it in the delay before someone unmutes, in the tension after a roadmap shift, and in the quiet attrition of both teammates and customers.

Nowhere is this more visible than in the game industry's long-standing reliance on crunch time, the late-stage death marches where teams work 60, 70, 80-hour weeks to hit a ship date. Executives cite passion. Teams call it what it is: avoidable. The rituals of *"just one more sprint,"* of all-hands war rooms, of praise for pulling all-nighters get treated as signs of commitment when they are actually signals of failure: a failure to listen, to plan, to

build sustainable systems, and to treat the team as human beings instead of headcount.

This is where product management has a second, often overlooked role. Yes, product is the voice of the user inside the development team. But product is also the shield of the team against the wrong voices from above. A good PM doesn't just absorb pressure from the top and pass it down. A good PM pushes back, uses data to say no to date-driven development, advocates for pacing instead of panic, and protects the team's ability to think, breathe, and build well, even when the deadline is loud.

Our goal isn't to meet an investor's timeline or an executive's forecast. It's to build the best product to solve our user's mission.

And the only way to do that sustainably, meaningfully, and well is to listen, to your body, to your team, to your users, and to the mission.

CHANGE THE PATTERN, NOT THE PRACTICE

CHAPTER 03 • SECTION 3.3

Sometimes listening reveals that the ritual itself needs to change, and when things stop working, you don't abandon the ritual, you adapt it. Progress isn't a straight line, it's a cycle of push, plateau, and pivot. When you hit the plateau and the usual ritual no longer delivers results, that is not a sign to quit but a sign to evolve.

In the gym, this happens all the time. You run a successful squat cycle, adding five pounds a week like clockwork, and then you stall. Your knees cave, your speed slows, and the bar starts winning. The answer is not to scrap the movement but to change the pattern. Maybe you shift to pause squats, change your stance, or drop the volume to focus on recovery. The ritual of showing up and squatting stays, and only the shape of it changes.

A product team stalls the same way, and the fix is the same. The standup that once helped your team sync becomes a box-checking chore. The planning meeting that used to set priorities now spirals into status updates. That doesn't mean you stop planning, it means you shift how you plan. You move from live check-ins to async threads, and you replace calendar fatigue with focused, flexible rituals that match what your team needs in its current phase of growth. Rituals that don't evolve become rules, and rules, as we have seen, break people.

This is especially true in globally distributed teams. At Elastic, our workforce spans time zones and continents, and we had to learn early that rituals built for co-located teams don't translate. A sync meeting at 10 a.m. in California is 7 p.m. in Berlin and 2:30 a.m. in Sydney. So we changed the pattern and moved toward asynchronous rhythms:

- Key decisions live in documents, not meetings.

- Slack threads replace sidebars.
- Recorded meetings include transcripts and tagged callouts.
- Big calls are followed by quiet time, space for global teammates to reflect, respond, and contribute.

We didn't stop collaborating, we restructured how and when it happens. The ritual of cross-team communication stayed, its shape changed, and it made space for more voices, not fewer.

We are not the only team that publicly evolved its rituals as it grew. Linear has documented how they shifted from rigid sprints to six-week cycles, lightweight async-first standups, and tighter scope-cutting rituals. The cadence changed and the mission did not. Their team guide reads like a working document of how rituals should evolve as the company evolves around them.

The newest version of this is happening in 2026 with AI. Standups now run with AI-generated summaries instead of live recaps. Retros surface patterns from team data that nobody had the time to read on their own, and mock reviews include an AI co-reviewer. The ritual is still the ritual (show up, learn, adapt), but the form is shifting fast. That is not a problem, it's a sign that rails can take new shapes when the train evolves. I'll come back to what AI changes here, and what it doesn't, in the chapter on AI.

What matters isn't how you do it, it's that you keep showing up with purpose. You hit a wall, you adjust, and you don't abandon the work, you change the pattern. That is the lesson: rituals serve the mission, and when they stop serving it, you reshape them. Don't confuse rigidity for discipline, and don't let the form matter more than the function. (And please, don't treat your favorite product management book like doctrine. Those frameworks weren't written for your team. Your mission was.)

Rituals aren't constraints. They're commitments, but only if we let them evolve. The strongest systems, the longest-lasting teams, and the most resilient lifters all share this in common: they don't cling to routine for routine's sake. They adapt, with intention, with feedback, and with the mission in mind.

■■■ CHAPTER 04

04

FEEDBACK IS A SUPERPOWER

Trust is built one cue at a time. One adjustment. One shared win.

CUES, NOT CRITIQUES

CHAPTER 04 • SECTION 4.1

There is a distinction worth naming before anything else, because the whole chapter depends on it: *criticism* and *critique* are not the same word. Criticism announces what's wrong, and critique tries to make the work better. One is judgment and the other is investment. Criticism comes from someone who wants to be heard, and critique comes from someone who wants you to succeed. The same words can deliver either one, what changes is the care underneath.

This chapter is about a third thing entirely, because even the best critique can be too much in the moment. Under the bar, mid-swing, or mid-presentation, you don't need analysis. You need something tighter than that. You need a cue.

My mentor Nate Fick used to talk about the power of laser focus, and he did not mean attention. He meant precision. That phrase gets thrown around a lot, but he meant it in the truest sense: laser focus isn't about doing one thing, it's about doing the right thing, the move that creates the most impact and the shift that makes everything else click into place.

I saw that principle in action during my early days at Endgame. When I joined, we had four different products, all in different markets and serving different users, built with a small team and sold with an even smaller one. The problem wasn't that the ideas were bad. They weren't. Each one had real potential. But potential doesn't scale without focus, and Nate made a tough call. He chose to end-of-life three of the products, even though they were generating short-term revenue, and put every ounce of our talent behind a single one. It was a risk, and it paid off. We built an endpoint protection product that could go head to head with anyone in one of the most competitive markets in cybersecurity,

not because we chased everything but because we aligned everything to a single mission.

That's what laser focus looks like in the real world, and feedback should work the same way. When you're under pressure, under the bar or under deadline, you don't need a list of everything that's off. You need one cue, one phrase that slices through the noise and sticks when it counts.

POINT THE FLASHLIGHT

Baseball figured this out. Coaches used to flood hitters with advice mid-swing: *"Keep your hands back."* *"Level the bat."* *"Don't bail out."* All of it technically true, and none of it actually helpful in the moment.

Then came a better idea. Picture the knob of the bat as a flashlight. In the "flashlight position," you're aiming that light beam right at the catcher's face. This cue helps you set the correct bat angle, slightly upward, with the knob directed toward the target, and it's called the flashlight position because you're holding and pointing the bat the same way you'd shine a flashlight in someone's eyes. So the whole correction collapses to one word: *"Flashlight!"*

It's weird and vivid, and it works. The batter stops overthinking and starts moving with intention, the hips rotate, the swing tightens, and the power follows. The magic of laser-focused feedback is that it isn't more, it's clearer.

TWO WORDS THAT CHANGED THE LIFT

The same thing happens under the bar. Stefi Cohen is one of the most accomplished powerlifters on the planet, but even the best get stuck. During a heavy squat cycle, she was losing depth and collapsing forward, the kind of breakdown that could invite a checklist of mechanical critiques. Her coach didn't do that. The cue was two words: *"Knees out."*

Her glutes fired, her hips opened, and her position locked in, with no overcorrection and no overthinking, just a precise adjustment that reconnected the movement. Real feedback works like that: instead of flooding you with everything that's wrong, it puts a spotlight on the one thing that matters most right now.

FROM BACKLOG TO BREAKTHROUGH

In product development we're inundated with feedback. Users, developers, sales teams, executives, everyone has ideas, and most of them are shared with genuine excitement, because everyone wants the product to be better. But without focus we risk becoming a jack of all trades and a master of none. Chasing every suggestion means delivering none of them well.

The best product teams don't just collect feedback, they hone it. They find the thread, the theme, the one insight that can generate the most impact with the least investment. In software we can build almost anything, given infinite time and budget. But for some reason, executive teams rarely offer those. So it takes real leadership to sift through the noise, spot what matters most, and act.

Dropbox is a good example. They had a problem most product teams would recognize: users were signing up but not sticking around. Specifically, they were dropping off before installing the desktop client, the core part of the experience that made Dropbox more than just another web app. The team started spinning on solutions. Maybe the onboarding flow needed to be redesigned, maybe they needed more education, more nudges, more screens, and the backlog of ideas kept growing. Then a PM said something simple: *"You're treating the CTA like a destination, not a trigger."*

That one line cut through the noise. They changed the button copy from "Next" to "Install Dropbox," added a subtle animation to guide the user forward, and that was it. Conversion went up. There was no massive rebuild and no big campaign, just a focused shift that made it crystal clear what the user needed to do next.

What mattered wasn't the volume of feedback, it was knowing which piece would actually change the outcome.

That's product leadership: listening broadly, then acting precisely.

THE FLASHLIGHT, NOT THE FLOODLIGHT

The same principle applies across every domain I've worked in: lifting, sport, software. You don't have infinite time to build a product, you don't have infinite weights to lift and sculpt the perfect physique, and you can't act on every idea, every error, every impulse. So you focus. Whether you're adjusting your squat, refining your swing, or unblocking a user journey, the best feedback doesn't overwhelm, it illuminates.

You don't want a floodlight that blinds people or a laser that burns them. You want a flashlight, steady and clear, aimed at the one thing that matters right now. That's how progress actually happens, one cue and one rep at a time.

MAKE FEEDBACK A RITUAL

CHAPTER 04 • SECTION 4.2

Feedback isn't something you give once a quarter, and it's not a Slack comment or a surprise at review time. It's a rhythm, a rep. If cues are the spark, rituals are the circuit that keeps the current flowing. The strongest teams and the strongest lifters don't just react to feedback when it shows up, they build it in, expect it, practice it, and make it normal.

In lifting, you log your sets and reflect on what moved well, what felt off, and what needs attention tomorrow. Feedback there is a ritual rather than an event, and the same is true of product. If you're a product manager, I'll say it as plainly as I can:

If you're not talking to users, you are failing at your job.

I don't mean falling behind or missing a step. I mean failing. User feedback isn't a bonus, it's the core ritual of the role, and if you're not making regular space to listen, directly and personally, you're flying blind. You're not a scrum master and you're not a backlog babysitter. You are the voice of the user, and the user, and their mission, is why you have a job.

The research, the roadmaps, the revenue, all of it is an outcome of solving the user's problem, not the other way around. Too many teams fall into the trap of building for elegance, scale, or conversion, and forget to ask the most important question: *Does this move the mission forward?* Holding that line is your job as a PM. Metrics can drift and roadmaps can get noisy, but the mission stays clear if you keep listening.

SLACK: FEEDBACK AS THE PRODUCT

Slack didn't start out as a product idea at all. The team at Tiny Speck built it as an internal tool for themselves while working on a multiplayer game called Glitch. The game didn't succeed, but the internal chat tool did, because the team had built it by listening to their own pain.

They weren't running customer interviews or user panels. They were simply using the tool every day and treating their own experience as data. The engineers, designers, writers, and founders were all giving and receiving feedback constantly: what was slow, what was confusing, what needed to work better. The users were them, the feedback was constant, and the ritual was built into the way they worked. They didn't treat those observations as complaints. They treated them as cues, small signals that over time shaped something far more useful than they had originally intended.

So when Glitch shut down, the pivot to Slack wasn't a Hail Mary so much as a progression, because the team had already spent years listening to what they needed most and building it. Ritualized feedback didn't just improve the product, it revealed the product they should have been building all along. Slack became Slack not by guessing what users wanted but by listening to internal signals, consistently, honestly, and early.

ELASTIC: CUSTOMER ZERO AND DESIGN PARTNER RITUALS

We've seen the same thing at Elastic. Our internal information security team, "*customer zero*," is often the first to use upcoming Elastic Security features. They're not a test group. They're real users with real problems, and when something's unclear, slow, or missing, they tell us, early and often. Because they sit just a few channels away, we can respond quickly and refine before anything reaches broader release.

It's not just internal, either. Some of our most pivotal feedback comes from design partners, external users who've volunteered to be on the front lines with us. They opt into early access knowing the feature might be raw, knowing it might break, because they care about shaping something real, something that works not just in a demo but in a live environment.

These aren't one-offs or spontaneous bursts of goodwill. They're planned rituals, structured partnerships built into how we deliver great products, loops that make the product stronger long before it ever reaches general availability. Ritualized feedback has nothing to do with checking a box, it's how you build alongside the people who share the mission.

RELATIONSHIP-LEVEL LISTENING

Collecting feedback is the easy part. Getting someone to tell you what's on their mind is just the start, what matters is what you do next. Do you listen, or do you nod, say “*totally*,” and go back to your plan? The question is the same whether you're running a product team or a training log. You can run all the standups, retros, interviews, and logs you want, but if you're not listening with intent, you're just gathering noise, and you're not growing. Feedback is only useful if it lands, and that means learning how to listen, not just politely but purposefully.

LISTENING IS A LIFT

CHAPTER 04 • SECTION 4.3

You’ve built the ritual and you’re getting the feedback. Now comes the hard part, which is listening, not passively and not performatively, but actually listening in a way that helps you grow. The first thing to understand is this:

Being user-obsessed doesn’t mean the user is always right.

Sometimes users give you feedback in the form of a solution.

“Add a new button.” “Change this flow.” “Make it more like what Company X does.”

If you chase those suggestions blindly, you’re not listening, you’re outsourcing product design. The real job of a product manager is to listen deeper, to get past the request and find the root. Don’t treat the feedback as the answer. Treat it as a clue, because your job is to uncover the real problem.

One thing I’m adamant about with my PMs: we don’t hand our engineers a solution, we bring them a problem worth solving. That means doing the work, talking to users, studying how others have handled it, mapping the friction, and listening for what’s unsaid. We work with brilliant, creative engineers. Our job isn’t to steal the “how,” it’s to own the “why” and collaborate on the “how” together.

Feedback isn’t always clear or clean. It can be noisy, misdirected, emotional, subtle, or even wrong, and when you’re under pressure, in the middle of a hard training cycle or a high-stakes product push, it’s easy to hear what you want to hear, or to hear nothing at all. Listening is a skill, and it’s the one that separates people who just collect feedback from those who actually use it.

It's like lifting: you might record every set and log every number, but if you don't know what the soreness is telling you, if you don't know when to push and when to pause, you're not getting better. You're just getting tired. Sometimes the most accurate feedback in a training session isn't in the weight or the timer at all, it's in how the set felt. How many reps did you leave in the tank? What was your rate of perceived exertion? RIR and RPE are qualitative cues, and they only work if the lifter is honest, just like product feedback only works if the team is actually listening.

WHEN THE DATA LIES, OR WE LIE TO OURSELVES

Fitbit is a good example. When they rolled out sleep scores, users were thrilled: finally, a single number to tell you how well you slept. But the feedback loop backfired. People started optimizing for the score, going to bed earlier and waking up later, and still feeling exhausted. The metric didn't tell the whole story. It rewarded quantity, not quality, and it missed the impact of stress, caffeine, or real rest. Instead of helping people understand their bodies, it created sleep anxiety, people chasing a number instead of listening to what their bodies were actually telling them. This is the risk with metrics-as-truth: you end up listening to the wrong signal, just because it's the one that's easy to measure.

The same thing happens at scale. When Target expanded into Canada, the surface signals looked great: strong brand awareness, excited customers, big opening-week foot traffic. But underneath, the stores were suffering. Inventory systems were broken, shelves were empty, pricing was inconsistent, and operational feedback from store teams was ignored or deprioritized. Leadership focused on the shiny signals, the PR, the launch buzz, the optimism, and missed the messy truths on the ground. They listened to the brand metrics and headlines, not the store managers and logistics teams waving red flags. Within two years the entire operation collapsed, costing billions and ending in a full retreat.

When you only listen to what makes you feel good, you stop seeing what's real, and in product or business that kind of selective hearing is deadly. You don't need more metrics. You need better listening, the kind that filters the noise, finds the root, and says: *"I hear you. Let's fix the real thing."*

STRONG FEEDBACK, STRONG FOUNDATIONS

CHAPTER 04 • SECTION 4.4

I want us to strive for critique, not criticism, feedback that's constructive rather than combative. I've had to learn this over the course of my career. As a passionate product leader, I've had to walk a line: how do you bring intensity without intimidation? How do you make sure your excitement doesn't land as an insult? It's not always easy. Passion can blur the edges, and in fast-moving teams feedback can come fast and hot even when it's meant to help. The line I hold onto is this:

When feedback is anchored in empathy and structured around the mission, it becomes a lift, not a weight. It pushes people forward instead of pinning them down.

These lessons apply well beyond product and well beyond management. They show up in how we coach our teammates, how we parent, how we partner, how we grow. If something matters enough to say out loud, then it matters enough to deliver with care, because what you say is only part of it. How it lands is what makes it real.

STRONG FEEDBACK IS OFTEN MICRO

It's easy to think feedback has to be a big moment, a review or a reset or a speech. But most of the feedback that actually changes people, and changes outcomes, is micro: one cue, one adjustment, one rep at a time. Coaching works that way on the platform, great PMs guide a team that way, and it's how trust gets built and performance gets better.

In the gym, the best feedback is short and specific, and it sounds like this:

“Brace before the pull.” “You’re losing tension at the bottom.”

You don’t wait until after the meet to say it. You say it in the warm-up room, in the moment, when it counts. Product works the same way, and the cues sound just as plain:

“This feature’s drifting from the core user need. Let’s tighten it.”

“That’s a great insight. Let’s surface that earlier in the deck.”

Micro feedback avoids defensiveness. It’s less likely to be taken personally, because it’s just the next rep, done better.

SHARE EARLY, IMPROVE ALWAYS

Too many teams wait too long. They polish and perfect, and they fear showing something unfinished, so by the time the feedback comes, the team is too attached, or too far gone, to adapt. The best teams share early, which is the Medici principle: seek feedback while ideas are still flexible, not fixed, and let people shape the work before it’s locked in.

You can see this principle in action at Figma. From the start, Figma built real-time collaboration into their product, not as a feature but as a philosophy. Designers could share mockups midstream, collect comments in context, and adjust in the flow, with no long feedback loops and no over-polished reveals, just open collaboration one comment at a time.

At Elastic we embraced that same mindset, first in design and then across product teams. Figma became a shared space for early feedback: PMs sketch rough flows, designers wire up concepts, and teams review together before a line of code is written. Mock reviews aren’t a gate, they’re a ritual. And like everything else, we’ve evolved it.

In 2026, AI is reshaping the early-share ritual entirely. We use tools like Lovable to wireframe ideas in minutes instead of weeks.

PMs can upload an epic and get a working prototype back before the design review, and AI editorial models read drafts and ask the questions a senior PM would have asked. The feedback loop has gone from days to seconds. That's real, and it's mostly good, but only when the human at the center is doing the harder work AI can't do: actually listening to the user, actually carrying the mission, actually hearing what was unsaid in the room. I come back to this in the chapter on AI, because it deserves more than a paragraph.

Feedback doesn't always need to come through conversation, either. Look at Duolingo, one of the most successful learning platforms in the world, and proudly Pittsburgh-built. They've designed feedback directly into the product experience, so that from streak celebrations to in-app corrections, every interaction is a tiny nudge:

"You're close." "Try again." "You're on track."

There's no giant review and no sit-down critique, just micro feedback in real time, helping users improve without ever slowing them down.

The feedback rituals themselves are getting AI-augmented too. Tools like Dovetail now synthesize customer interviews automatically, pattern-matching across hundreds of conversations a PM would never have the time to read straight through. The right teams use it the way Elastic uses customer zero: not as a replacement for actually being in the room, but as a way to see what was said across all the rooms at once. AI is the editor of the feedback, and the PM is still the author of the response. The earlier you share, the better the outcome, and the smaller the feedback, the bigger the impact, if it comes at the right time.

STRONG FEEDBACK BUILDS STRONG PEOPLE

Strong feedback doesn't come from shouting. It comes from someone who's done the work, someone who's built themselves

up not just to be heard but to be helpful. The best coaches don't bark orders, they observe, they care, and they offer what helps, when it helps. The same rule applies in product. You don't build trust by waiting until things break. You build it one cue at a time, one adjustment, one shared win, with feedback that fuels instead of frustrates and builds instead of breaks.

Even in our personal lives the principle holds. A daily affirmation, a kind word, a check-in after a hard day: these are all acts of feedback. They tell someone how they're doing, and that you're still with them. That's how we get stronger as partners, as teammates, and as leaders, not through silence and not through softness. When it's anchored in empathy and aimed at the mission, feedback stops being friction and becomes fuel.

■■■ CHAPTER 05

05

PROGRESS ISN'T PRETTY

MASTERY IS REPETITION WITH FEEDBACK

CHAPTER 05 • SECTION 5.1

Practice doesn't make perfect. Perfect practice makes improvements.

That is what separates a hundred wasted hours from a hundred that actually move you forward. The reps you log have to be deliberate, they have to be honest, and they have to teach you something the next time you show up.

You can see it clearly in cybersecurity, where penetration tests are our version of reps under pressure: simulated real-world attacks run across teams, infrastructure, and products. We don't go easy, and we don't telegraph the punch. Sometimes we don't even tell the blue team it's happening, because defenders don't get a warning in the real world, and if we want to build muscle memory we need to simulate the actual weight. That is what *perfect practice* really means: not pristine, flawless action, but high-quality, high-context repetition.

Malcolm Gladwell's *10,000 Hour Rule*, popularized in *Outliers*, offers a compelling headline: do something for 10,000 hours and you'll become one of the best in the world at it. What often gets forgotten, and what Gladwell himself has acknowledged, is that the number only matters if those hours are deliberate, structured, and improving. It is not just any reps that get you there, it is the right reps, and that holds in lifting, in product, and in leadership.

THE LIFTING LENS: PERIODIZATION AND PROGRESSION

Walk into any well-run gym and you'll see programs: 5/3/1, the Texas Method, Juggernaut, Conjugate. Each one offers structure, progression, and intentional overload, and each is built on

periodization, which just means you cycle through intensities, movements, and recovery phases on purpose. It isn't sexy, but it works.

Chad Wesley Smith, founder of Juggernaut Training Systems, built JTS by emphasizing smart lifting over heavy lifting. As he puts it:

“Motivation gets you started. Discipline keeps you going. Feedback tells you where to go next.” — Chad Wesley Smith, founder of Juggernaut Training Systems

I use the JuggernautAI app myself. It takes in feedback on how I move, how I recover, and how I progress, then adjusts the plan accordingly, so every session has a purpose. It is a coach in your pocket, and a reminder that great outcomes come from smart, consistent reps.

Lifters learn something else the hard way: showing up and doing something beats waiting for the perfect plan. A light session with focused movement and intention will beat a skipped workout every time, and small improvements made consistently compound into real strength.

THE PRODUCT MIRROR: DISCIPLINED ITERATION AT ELASTIC

When Elastic Security shipped its initial security analytics and SIEM product in 2019, it wasn't a complete answer to the market. It was a start, informed by users, opinionated in structure, and designed to evolve. What made it successful wasn't just the launch, it was the loop: weekly user feedback, signal from real-world deployments, and disciplined iteration sprints that followed a clear roadmap.

Each product cycle was a planned lift, part of a broader program of growth, not a shot in the dark. Features like detection rules, case management, and timeline didn't just “appear.” They were

reps, refined under load. We looked at how users engaged, what didn't click, and what needed retraining, and we built telemetry into the stack, not to track vanity, but to see where improvement was possible.

The discipline scales beyond security. Watch how Anthropic has rolled out Claude from 2023 through 2026: a deliberate cadence of model versions, capability updates documented in public changelogs, and a clear deprecation path that respects the developers building on the platform. Claude 3 to 3.5 to 4 to 4.5 to Opus 4.6 was not a series of sudden leaps. It was a planned program of reps, in public, refined under load. The market saw the releases, and the team felt the loop.

REPS WITH A PURPOSE

Whether you're logging lifts or logging bugs, the idea is the same: feedback closes the loop. Reps without it just reinforce habits, good or bad. Reps with it are where you find progress.

Athletes track tempo, range, and fatigue. Product teams track usage, drop-off, and latency. Neither discipline rewards brute force for long, but both reward the people who show up, take notes, and come back better.

In the gym, a lifter might swap from high-bar squats to pause squats to work through a sticking point. In product, a team might start dogfooding an unfinished feature to catch friction early. In both cases the rep is the mechanism, and the lesson comes from how you interpret it.

THE GRIND THAT GROWS

CHAPTER 05 • SECTION 5.2

The reps that change you aren't the glamorous ones. They aren't the PR attempts, the launch keynotes, or the LinkedIn flexes. The reps that build real strength, in the gym and in the product, are the ones nobody sees: the early morning warmups, the late-night bug fixes, the process of showing up, adjusting, refining, and repeating. This is the grind, and it's where the gains are made.

IN THE GYM: WARMUPS, NOT MAX OUTS

You can spot the novices in any weight room, because they go straight for the heaviest lift they can manage. They max out on deadlifts, post it on Instagram, and then disappear for weeks. The ones who stick around warm up, move methodically, hit moderate numbers with perfect form, log their progress, and show up again tomorrow.

Warming up is not a sign of weakness, it is the mark of a seasoned lifter. It is protection, preparation, and part of the process. As Chad Wesley Smith and countless other coaches remind us, progress is built on consistency, not bravado.

IN PRODUCT: QUIET WINS THAT MATTER

Product teams fall into the same trap. We celebrate the big splashy features, but the real loyalty comes from the quiet wins: the “minor” UX update that shaves 10 clicks off a daily workflow, the improved loading time, the default that finally makes sense.

We saw this first-hand at Endgame. Yes, we differentiated on high-end protections like in-memory attack prevention, but the reason our champions stayed engaged wasn't just the cool stuff, it was the continuous improvement in how they used the product.

With each release we delivered smoother experiences and more intuitive workflows, and it added up.

The same held true at Elastic Security, where we spent over a year deeply focused on the alert triage experience. We met with analysts, we compiled hundreds of hours of feedback, and we made sure everything they needed, the context, the next steps, and a way to act on it, was right at their fingertips. That was not a flashy launch, it was grinding, and it paid off.

Not every enhancement gets a press release. But the users notice, and often celebrate, the small, thoughtful changes more than the big ones.

WHAT THE GRIND TEACHES

The grind teaches humility, discipline, and attention to detail. It teaches you to care about the user who files enhancement tickets, not just the buyer who signs the deal, and it teaches you to find progress in what looks minor. In product that means tackling the long list of enhancement requests. In lifting it means refining your bar path or your ankle mobility. Both require you to step out of the spotlight and into the discipline of reps.

THE MYTH OF MOTIVATION

The myth is that motivation carries you. Motivation gets you started, but it won't carry you through the hard sets, the long roadmap, or the friction. What will is mission, ritual, feedback, and community.

The best product managers and lifters don't chase the end state, they chase the process, and somewhere along the way they fall in love with it. That is where mastery begins.

LOOK BACK TO SEE THE GAINS

Progress is sneaky. When you're in it every day it's hard to see, which is why lifters take progress pictures, not for vanity but for truth. I've had stretches where I felt completely stuck, only to look at side-by-side photos and realize I had been growing all along.

Product has the same blind spot. One of the best presentations I gave at Endgame was a demo showing the same workflow over multiple years. Each version looked like a small step on its own, but side-by-side it was night and day: better design, better defaults, better detection. That is the power of consistent improvement, and you only see it when you look back.

CHANGE THE PHASE, NOT THE PROCESS

CHAPTER 05 • SECTION 5.3

Anyone who's followed a good lifting program knows the feeling: what used to work stops working, you stall, you plateau, you feel stuck. The worst response is to panic and start over. The best response is to adjust the phase and keep the process.

In powerlifting, this is where periodization becomes personal. You might deload, shift your focus to speed or hypertrophy, swap bars, or change your stance, but you don't throw away your structure. You modify it with purpose.

Product development works the same way. You don't abandon the mission when progress slows, you evolve the strategy and change the shape of the work.

PRODUCT EXAMPLE: SCALING FOR WHAT'S NEXT

Early in Endgame's life, we took an almost nine-month pause on new features to rearchitect the platform for long-term scale and performance. It was a scary bet, and there were plenty of sleepless nights wondering if it was the right call. But when we brought the new build to a major deployment and watched the blue team "win" their live training exercise for the first time, we knew it had paid off. Their expertise made it happen, and our new platform and agent helped make it possible.

Sometimes changing the phase means giving up momentum now to build strength you can use later. That takes guts, but it's part of the process.

LIFTERS ADJUST, TOO

Smart lifters know when to change gears. That might mean trying a new program, like shifting from 5/3/1 to Juggernaut, or letting an AI-based plan like JuggernautAI retune the work based on fatigue and bar speed. Sometimes it means getting a personal coach, or joining a lifter forum to troubleshoot sticking points. What matters is sticking to the discipline: you're still logging reps and still progressing with intention. The ritual stays and the phase shifts.

Which brings me to the new wrinkle in 2026. AI doesn't just track your reps anymore. It adjusts the plan based on how the bar moved last week, so the program responds to you, and the only thing that can break the loop is whether you show up honest. There is a trade in that, and I'll come back to it in the chapter on AI.

SET A GOAL TO STAY MOVING

During COVID, lifting alone in my garage, motivation came from an unexpected place: I signed up for a powerlifting meet. I wasn't planning to set any records, but having a date on the calendar gave me focus.

That meet, and the ones that followed, taught me something else. Competition isn't about beating others. It's about beating the weight. The community is there to help you do exactly that, right down to your "opponents" cheering you on.

The same lesson applies in product. When you're feeling stuck, talk to your users and talk to your peers. They'll remind you why you're doing it, and they'll help you find the next rep.

Even when you change the phase (the load, the format, the plan), your mission stays, your ritual stays, and the growth continues.

GROWTH THAT HOLDS

CHAPTER 05 • SECTION 5.4

There's a difference between strength that shows up and strength that holds up, and that difference comes from experience, from failure, and from learning the hard way.

We saw it earlier in the story of Hafthor Björnsson, the world's strongest man, who tore his pec pushing beyond safe limits. He later called it his “biggest mistake” and rebuilt with a smarter plan. The same pattern shows up again and again in high-level lifting. Even Stefi Cohen, one of the most decorated lifters of her generation, has shifted her focus toward long-term health, adjusting how she trains, eats, and recovers, not out of fear but out of wisdom. These lessons apply anywhere high performance matters.

PRODUCT EXAMPLE: BUILD FAST, LEARN FASTER

At Endgame, we learned a critical lesson well before the world-shaking CrowdStrike outage of 2024. We had shipped a powerful capability: the ability to update our machine learning-based malware prevention engine out of cycle from the main product release. It meant our users got faster protection without waiting for a full product upgrade. It was the right feature, and it had an unintended consequence.

During Black Friday at one of our retail customers, an update disrupted point-of-sale systems. Nothing catastrophic, but enough to make an impact. We fixed it fast, added guardrails, changed our rollout process, and never made the same mistake again. More importantly, we kept the feature and improved how it worked for the user, at their scale, in their implementation.

The best product capabilities don't just “work.” They hold up. They account for real-world usage, edge cases, and the 80/20 rule,

the fact that 80% of your issues will come from 20% of your scenarios, and we built resilience into the system because of it.

THE PRODUCT TAKEAWAY

Your best ideas will cause friction if they aren't paired with empathy. It is not enough to be right. You also need to be reliable, and the only way to get there is through reps that test the system, expose the edges, and give you time to learn and evolve. That is how mature products, and mature lifters, endure.

■■■ CHAPTER 06

06

THE MISSION DEMANDS RECOVERY

THE BIOLOGY OF BOUNCE BACK

CHAPTER 06 • SECTION 6.1

Recovery isn't retreat. It's reinforcement. Whether you're lifting heavy or leading strong, progress is about what you recover from, not just what you do. And yet in gyms and boardrooms alike, recovery gets treated as weakness, wasted time, or something you'll "get to later." When stress hits or a deadline looms, it is usually the first thing cut, and that mindset breaks things.

Everyone repeats the line that "*it's a marathon, not a sprint*," but even marathons have aid stations. Recovery is not the opposite of performance, it is what makes performance possible. You'll notice a pattern: the strongest systems, bodies, and teams are built on rhythms rather than sprints, and the ones that fall apart usually forgot to rest.

THE YEARS RECOVERY VANISHED

During the pandemic the commute disappeared, and with it went the last buffer between work and rest. Working from home looked like a win, until days started with a Slack notification and ended with Zoom still open. Lunch breaks were replaced by back-to-back meetings, evenings bled into late-night emails, and there was no off switch, just a lower screen brightness. People didn't stop working. They stopped recovering.

It wasn't the difficulty of the tasks that did the damage, it was the absence of boundaries. Parents toggled between spreadsheets and homework help without leaving their chairs. Managers tried to hold their teams together through webcams and chat threads. Even rest became one more thing to optimize: a new podcast, a sleep tracker, a mindfulness app squeezed in before the next call.

Burnout crept in sideways, not as a dramatic collapse but as a slow erosion of clarity, patience, and presence. The work still got

done while the purpose behind it got blurry. People didn't crash so much as fade, and not because they cared too little. They were never given the space to come up for air. Recovery wasn't just missing. It had been overwritten.

MAT FRASER AND THE DISCIPLINE OF RECOVERY

That same lesson echoed far beyond the home office. Mat Fraser, five-time CrossFit Games champion, wasn't always the strongest on paper, but he outlasted everyone. His secret was obsessive recovery: sleep tracked with Whoop, daily heart rate variability, nutrition managed to the ounce, mobility, ice baths, light movement on off days, nothing left to chance. He saw rest as the difference between surviving and dominating. In his own words:

“I do everything right, especially the boring stuff.”

That “boring stuff” is what let him stay healthy, adapt faster, and build a career that eclipsed stronger but less disciplined competitors.

BASECAMP'S BUILT-IN COOLDOWN

The same mindset shows up in software. Basecamp built recovery into their operating rhythm: after every six-week product cycle, where teams focused on delivering something real, they took two weeks off from planned work. These cooldowns weren't vacations. They were time to reset, fix bugs, explore ideas, or recover team energy, with no deadlines and no pressure to deliver. That wasn't laziness, it was strategy. Founders Jason Fried and David Heinemeier Hansson believed sustainable work required ebb and flow, and that without that rhythm quality would slip and burnout would rise. Instead of asking their team to be superhuman, they asked them to be consistent and gave them the space to do it.

G2 ESPORTS AND THE POWER OF TOURNAMENT RECOVERY

Recovery isn't only for traditional sports or software teams. In the high-stakes world of esports, the teams that build recovery into their cycle gain a lasting edge.

G2 Esports, one of the most successful organizations in Valorant, is a prime example. After a disappointing showing in 2023, the team deliberately adjusted its approach, adding more cooldown time between matches and cutting the number of high-pressure scrims. The goal wasn't to train less, it was to train smarter, to recover, and to breathe. The results spoke for themselves. G2 won the VCT Americas Stage 1 title in 2024 and reached the Grand Final at Masters Bangkok, pushing T1 to a five-map series. They didn't take the trophy, but their ability to perform tournament after tournament was proof of a system built for endurance.

THE CHALLENGER DISASTER AND THE TRAGIC COST OF SKIPPING THE PAUSE

When recovery is missing, the cost isn't just performance, it can be people's lives.

I wrote in *Rituals Over Rules* that “...our goal isn't to meet an investor's timeline or an executive's forecast. It's to build the best product to solve our user's mission.” That perspective doesn't just apply to shipping code. It applies to every system that carries real risk.

In 1986, engineers at Morton Thiokol warned that cold weather could compromise the space shuttle Challenger's O-ring seals. The data was there and the risk was known, but leadership, under pressure to meet a schedule, pushed forward anyway. The launch went ahead, and seventy-three seconds later the Challenger exploded, killing all seven crew members. The physical cause was the O-ring failure. The systemic cause was the inability to pause. There was no cultural space for dissent and no moment to reflect. The organization was sprinting politically, reputationally, and

economically, with no built-in mechanism for recovery or review. It was a tragedy, and a preventable one, brought on by the absence of a pause.

EVERNOTE AND THE DRIFT WITHOUT REFLECTION

That same cost plays out in the digital world, and this is where the Drift comes back. The Drift, the slow inversion of mission into metric that I named in Chapter 1, does not announce itself, rarely arrives with bad intent, and does not stop at launch dates. There is a recovery-shaped Drift too, and it looks like an unreflective sprint that nobody calls a sprint anymore.

Evernote was once the darling of productivity tools, with a loyal user base and a clear mission. But as it scaled it kept adding: more features, more integrations, more complexity, and never any time to reflect, consolidate, or revisit its core value. Internal teams were stretched thin, technical debt piled up, and bugs increased. The product lost its identity under the weight of unchecked ambition, and as the team chased innovation without rest, users quietly left for simpler, clearer alternatives. Evernote didn't fail overnight. It drifted, feature by feature and update by update, away from what had made it valuable in the first place, all because recovery was never part of the plan.

Boeing's Drift killed people, Hafthor's Drift tore his pec, and Evernote's Drift cost the company its identity. The mechanism is the same: the mission gets buried under the metric, the pause gets skipped, and by the time you notice, the thing you were building has become something else.

PROTECT THE PAUSE

Recovery doesn't happen by accident. It has to be built in, programmed into cycles and protected by boundaries, because strength is built less in the moment you push than in the space between pushes, if you protect that space.

Recovery is strategy. It is not the opposite of work, it is how the work keeps getting done. Growth requires rest, and not just any rest: intentional, protected, repeated rest. When you plan for recovery you're not falling behind, you're investing in your future resilience. The mission doesn't just demand effort, it demands endurance.

RAILS, NOT BARRIERS

CHAPTER 06 • SECTION 6.2

Boundaries aren't barriers so much as rails. They don't box you in, they keep you from going off track.

In lifting the rails are obvious: rest days, deload weeks, technique sessions. You can grind all you want, but if you don't recover inside that structure the system breaks, and not always with a snap. Sometimes it is a slow slide into a fatigue you can't name.

In product the rails are harder to see, and harder to hold. The work is rarely clean. It shifts constantly between strategy and triage, vision decks one moment and sales escalations the next, until context-switching becomes the default and what you planned gets pushed aside by what the business demands right now. Instead of pretending we can block out perfect "no meeting days," the better move is to build rails that expect the chaos and still protect the time to think clearly.

Call them strategy blocks, step-back time, or mental deloads, the name doesn't matter, but the intent does. You are building in space that lifts your head above the noise and lets you make intentional decisions instead of reactive ones. Rails aren't rigidity, they're protection, for your focus, your energy, and the mission.

NETFLIX AND THE SPACE TO REFLECT

Even in a high-performance culture like Netflix, boundaries around strategic thinking are built into the system. Product leaders are expected to pause regularly and reflect, not just on what they're building but on who is building it. Their well-known "Keeper Test" asks a simple but revealing question: *Would I rehire this person for this role today?* Answering that honestly takes courage, and it also takes time, time to zoom out and get quiet enough to think clearly. In a culture that thrives on speed, those

reflections are what keep the team aligned, accountable, and evolving.

Step-back time doesn't have to be silent. It just has to be sacred.

SUSTAINABLE STRENGTH

CHAPTER 06 • SECTION 6.3

Recovery is not a reward, it is part of the plan.

In strength training, the most disciplined athletes don't just train hard, they track what fuels the work: calories, sleep, macros. Performance isn't only about what you do in the gym, it is about what you support outside of it, which is why tools like MacroFactor have become essential for serious lifters. Not for vanity, for visibility, so that every training block is fed with what it needs to grow.

The same principle applies in product. You can't build a resilient team without knowing what you're feeding it, and that is where tools like Jira, Aha!, or Linear come in, not just as ticket trackers but as visibility engines. They let you zoom out, spot overtraining, and identify where the strategic work is undernourished. Recovery in product isn't just about taking breaks. It is about sustaining the energy to build well over time, because burnout doesn't usually come from sprinting, it comes from sprinting without a cycle.

This is why elite lifters use periodization, planning not just the next workout but the next month, quarter, and year. They alternate intensities, deload, peak, and rebuild, and not because they're lazy. They're playing the long game.

Sustainable product teams follow the same rhythm. They don't live in permanent crunch. They push when they have to, then deliberately create time to reflect, retool, or recharge. They respect the difference between urgency and importance, and they recognize that more activity doesn't always mean more progress.

When you track your macros, you don't just know what you're eating, you know what you're aiming for. When you track your

product macros, the balance of innovation, maintenance, user research, and downtime, you build not just velocity but viability.

One example of this kind of tracking comes from Atlassian's Team Health Monitors. These are not daily scrums or sprint reviews. They are recurring, focused check-ins designed to assess the long-term health of a team. Each one reviews key areas: clarity of roles, alignment on goals, confidence in decisions, pace of delivery, and engagement with stakeholders. Teams score themselves on a red-yellow-green scale so patterns show up over time. The point isn't to be perfect, it is to stay aware: to notice stress points early, invest in what's working, and surface risks before they derail momentum. It's macro tracking for the makers, less about this week's burndown and more about whether the system is still healthy enough to support what's next.

The strongest teams aren't the ones who go the hardest. They're the ones who stay strong the longest.

WHEN YOUR TEAMMATE DOESN'T SLEEP

There's a new variable in 2026 worth naming. AI doesn't sleep, it doesn't deload, and it doesn't take Q4 off to recover for Q1. The pace of an AI-augmented team is now set, in part, by a teammate that has no biology and no boundaries. The risk isn't that AI burns out. It's that the humans pairing with AI start absorbing AI's pace as their own. The pace of the AI is not the pace of the mission. I'll come back to this in the chapter on AI.

RECOVERY IS A LEADERSHIP SKILL

If you want to go the distance, as an athlete, a builder, or a leader, you can't just train intensity. You have to train sustainability. Recovery isn't about stepping back, it's about stepping up with clearer focus, steadier energy, and decisions made from purpose instead of panic.

In the gym you build this with sleep, nutrition, deloads, and reflection. In product you build it with boundaries, cooldowns, strategy days, and macro awareness. You build it when you protect the pause, when you track more than just tickets, and when you care not just about the sprint but about who is still standing after it. The mission won't slow down, but you can build systems, and teams, that last.

RECOVERY CREATES ROOM FOR PERSPECTIVE

CHAPTER 06 • SECTION 6.4

Halfway through the book, in a chapter all about recovery, I want to pause on something that too often gets misunderstood or misused in product work: diversity as a design principle.

The acronym DEI has been politicized and weaponized. The principle behind it is older than the acronym and more useful than the politics, because the enemy of clarity isn't chaos. It's assumption. When your product is only shaped by people who already know how to use it, you stop seeing what's broken.

Think about the average enterprise tool: bloated, confusing, and clunky, not because the teams behind them don't care but because they've learned to work around the flaws. They stop noticing friction because they've internalized the shortcuts, and then they add more complexity without questioning the base layer. That isn't innovation, that's calcification.

Remember Apple's infamous iPhone 4 moment? When reception dropped if the device was held a certain way, the official response was: "*You're holding it wrong.*" That wasn't just a PR misstep, it was a failure of empathy: a product built with a single use case in mind and a team unwilling to question it.

This is where diverse inputs become a design discipline rather than a slogan or a checkbox, an actual practice. When you bring in voices that don't match your defaults, different backgrounds, different abilities, different ways of thinking, you create friction that reveals blind spots, and you build products that more people can actually use.

The Medici Group teaches a powerful example of this in their innovation workshops: hospitals learning from Formula 1 pit

crews. Two entirely different fields, surgery and motorsport, sharing best practices to reduce patient handoff time in operating rooms. The result was faster triage, fewer errors, and lives saved. That's what happens when you step outside your bubble and let diversity expand your playbook. And sometimes that kind of inclusion is quieter, but just as critical.

RESPECT THE PAUSES

Diversity comes in many forms, including language. At Elastic, where teams span the globe, English is the default for most business communication, but it isn't the first language for many Elasticians, and that matters more than most people realize.

In a leadership training, one of our engineering leaders walked the room through what happens cognitively when you're a non-native English speaker in a fast-moving meeting. You listen, you process, you translate, you form a thought, and then you translate again to respond. That isn't delay, that's effort, and if you interrupt the pause where that work happens, you erase the contribution before it can surface.

Respecting the pause allows full participation. It gives space not just for language translation but for different processing styles, communication rhythms, neurodiversity, and accessibility needs.

Internally we called it the curb-cut effect. Curb ramps were designed for wheelchairs, but now they help everyone: people with strollers, luggage, bikes, injuries. What was built for access became a better default for all. Respecting the pause works the same way. It's a small behavior that opens the door to a much wider room.

■ ■ ■ CHAPTER 07

07

**TRAIN THE ENGINE, NOT
JUST THE OUTPUT**

WORK CAPACITY OVER WINDOW DRESSING

CHAPTER 07 • SECTION 7.1

There is a difference between looking strong and being strong, and you see it in the gym all the time. The lifter who chases a one-rep max every week, treating PRs like progress reports, looks impressive until the plateaus hit or the pain sets in. What you don't see as often is the lifter dragging a sled after squats, doing walking lunges in the cold, rowing in the morning and hitting accessories at night. That is the engine work, and that is capacity. If you want to go far, build the lungs before the legs.

In the training world this is called GPP, General Physical Preparedness, and it is more than a warmup or conditioning. It is the foundation everything else sits on. GPP improves recovery between sets and sessions. It builds joint integrity, tissue resilience, and work tolerance, and it makes your system ready to train harder, recover faster, and adapt more consistently. And yet in a lot of strength circles it gets dismissed. You'll hear things like:

- *“Combo sets are my cardio.”*
- *“I don't have time for fluff. Just the main lifts.”*
- *“If it doesn't add pounds to the bar, it's a distraction.”*

That is the specialization trap, and it is seductive, because specialized programs promise fast results. Just do the thing you want to improve, more of it. It works until it doesn't, until your joints hurt, your energy fades, your momentum disappears, and you burn out.

Repetition without variation isn't just physically risky, it is psychologically draining. Even the most disciplined lifter starts dreading the next workout, and even the most motivated developer begins to disengage. I've seen this in teams that only

work on performance, or only ship new features. The work becomes mechanical, morale suffers, curiosity fades, and the team ends up strong in one motion but brittle under real-world load.

That is why smart teams, and smart lifters, build in variation. Take the 6/2 cycle popularized by Basecamp: six weeks of deep, focused work followed by two weeks of cooldown. That is capacity training, not a break. We looked at it in Chapter 6, and other companies have since adopted and evolved it because it works. GPP isn't glamorous, but it is what lets you train hard today and show up strong again tomorrow.

Alex Viada understood that. A biomedical engineer and hybrid athlete, Viada rejected the false binary between strength and endurance. He trained for both, and he thrived. While most lifters feared that conditioning would eat their gains, Viada built an aerobic base big enough to carry heavy squats and sub-5:00 miles. His results weren't just impressive, they were repeatable and durable.

You see the same principle in product teams. Linear didn't try to dazzle with a full feature suite out of the gate. Instead they trained their engine, performance: every click, every transition, every load state was built to feel instant, even offline. That invisible investment became their advantage. Users stayed focused, fast, and frictionless, and while competitors stacked features, Linear scaled loyalty.

The obsession with output can take an even darker turn, though, in the gym and in the market. Some lifters now chase not even performance but the appearance of performance. Injections like synthol or site-enhancing oils artificially inflate muscle volume in the biceps, shoulders, and traps to create the illusion of strength, with no increase in output or health, just ballooned tissue under the skin. These are vanity muscles, pure and simple, and in too many cases they don't just harm the lifter's reputation. They destroy the lifter's body, through heart failure, sepsis, amputation, and in some cases death.

When looking strong matters more than being strong, the mission is already lost.

Product teams do the same thing with vanity metrics, injecting them into roadmaps: flashy dashboards no one uses, AI features built for the pitch deck, slideware that outpaces software. It might look good in the moment, but behind the scenes the engine is breaking down. I'll come back to the AI version of this in the chapter on AI, because when the model can generate any output you ask it for, the question of what is actually under the hood becomes the only one that matters.

You can fake a feature and you can fake a max lift, but you can't fake the foundation. Burnout is what happens when you try to specialize your way out of exhaustion. Capacity is what happens when you train for the long haul. The ones who last don't just train the output, they train the system behind it.

INTERNAL STRENGTH FOR EXTERNAL LOAD

CHAPTER 07 • SECTION 7.2

Strength isn't just about what you can lift. It's about what you can withstand.

Anyone can show up strong once. The mission demands more than that: it demands repeatability, resilience, and the ability to show up strong again and again, under pressure, under uncertainty, under load. That kind of strength doesn't come from testing yourself every day. It comes from building yourself for the test, from the inside out.

Lifters learn this the hard way. If you neglect your stabilizers, your joints, your breath control, your bracing, it doesn't matter what your numbers look like. You'll break. The biggest total in the gym means nothing if your back gives out the next week, because true strength is not just the output, it is the integrity of the system supporting it. The best lifters I know don't chase the max, they train the margin.

Amanda Lawrence understands that. A multi-time world champion powerlifter, Amanda is famous not just for her records, squatting over 600 pounds raw at 84kg, but for her poise under pressure. She visualizes every meet lift weeks in advance, rehearses the rituals, and manages recovery like a professional sport. She trains her nervous system, her mental process, and her ability to stay composed under load, not just her muscles, and that internal strength, not quad size or grip, is what lets her hit massive lifts on the world stage even when the bar bends and the cameras are rolling.

THEY TRAINED THE TENDONS OF THE PRODUCT, NOT JUST THE MUSCLE

In product, that internal strength is the architecture nobody sees, and Notion is the example I reach for. Notion wasn't always a darling. In 2015 they were nearly dead, with no traction and technical debt piling up. The team had two choices: patch the pain and push forward, or stop, go dark, and rebuild the core from scratch.

They chose the hard route. Two engineers rewrote the entire editor engine over 18 months, with no releases and no hype, just deep technical investment in a stronger, more flexible system. They bet that the internal strength of the product, not surface-level features, would determine their long-term viability, and they were right. That rebuilt core became the foundation for everything that followed: blocks, embeds, team permissions, scalable collaboration. The invisible architecture made possible everything the user eventually saw. What saved Notion wasn't a sprint, it was a rebuild.

Throughout my career I've watched scale and stability work get dismissed as unexciting, not flashy enough for slides and not "pressable" enough for headlines. Some leaders fall into the trap of always needing something new to talk about, something shippable that demos well. That pressure leads to bloated products, incoherent strategies, and worst of all, users who suffer when the product finally meets real-world load. When everything matters most, the engine breaks.

Capability refinement is not the boring work, it is the hard work, the place where the most difficult engineering problems live and where the most intricate, high-stakes user requirements get applied, not in the pitch deck but in the heat of usage.

Building a reliable core doesn't mean every startup needs to design for a Fortune 10 on day one. It does mean carving out time in the roadmap to move deliberately in that direction, and asking the hard questions early. Not just "*What are we building?*" but

“Who are we building it for?” and, just as critically, *“Who are we not building it for?”* You cannot build for every user in every vertical in every geo all at once. Trying leads to brittle systems and vague products that serve no one well.

Laser focus is strength. Define your product requirements, define your user, define the scale, define your edge cases and your tests, and then do the work, especially the work that doesn’t make the press release. That is where real durability comes from, not the big reveal but the boring reps.

A STORY I’VE LIVED

In July 2016, as I described in the prologue, my engineering lead and I stood on the floor of the Combined Air Operations Center at Nellis, watching our agent run through a live Air Force exercise. The story behind that moment starts earlier.

Early at Endgame, after CEO Nate Fick made the difficult but necessary decision to narrow our product portfolio to one core offering, engineering leader Tony Meehan and I found ourselves at a crossroads. The product we had was powerful. It delivered real results, and we had major enterprise deals on the horizon. But the architecture wasn’t built for scale, and the team had shown clearly that it wouldn’t hold as we moved into larger opportunities.

We could have coasted, closed the deals, and deferred the hard part. But we knew that if we built a base of users on that foundation, the eventual transition would be expensive and painful. So in early 2016 we made the call to rebuild. We moved the front end to a more modern language, redesigned the back end with a new queuing architecture, and rewrote how the endpoint agent communicated with the platform. All of it had to be done in under six months, alongside new features, for a critical delivery with the U.S. Department of Defense.

It was brutal: long hours, hard conversations, and constant doubt. But standing in that live DoD exercise, watching operators

succeed with what we had built, it was clear the effort had been worth it. The new architecture held. It scaled, and it supported the mission until we joined Elastic in 2019.

Internal strength isn't flashy. But it's what gets you through the weight that would break someone else.

WHAT POWERS YOU?

CHAPTER 07 • SECTION 7.3

The fastest engines in the world still go nowhere without fuel. You can have systems as good as anyone's, perfect technique, and an unbreakable schedule, but without something driving you, a reason to push through when it's hard and a mission that makes the effort matter, the engine stalls. Strength without fuel is just potential.

This is the third layer of performance. After physical preparation and mental resilience comes purpose, the why behind the work, the force that powers the engine when the load gets heavy and the results are still a long way off.

You can see the difference on the platform. Some lifters are chasing numbers. Others are lifting for something deeper: to test themselves, to prove something to a younger version of who they were, or to inspire someone watching from the crowd. The same weight moves differently depending on what's driving it. Product teams move the same way, and the ones that ship fastest aren't just well organized. They're aligned around a purpose they care about. They understand the mission, they know what their work means to the people who use it, and that makes them more resilient, not just more productive.

When the fuel runs low, purpose drives on.

Take Kristy Hawkins. Before she was a record-breaking powerlifter, she was a biochemical engineer at Genentech, and whether in a lab or under a barbell she trains with the same energy source: a relentless drive to understand, improve, and own her progress. She's powered by process, not comparison, and that is what makes her strength sustainable.

Teams run on the same fuel. Look at how Superhuman built their product. Founder Rahul Vohra didn't just want to make a faster inbox, he wanted to build the fastest, most delightful email experience ever created, and they didn't launch until users said they'd be "*very disappointed*" if they lost the product. That wasn't marketing polish, it was purpose, measured. Every decision, from UI transitions to onboarding flow, was shaped by that internal fire: delight, clarity, joy. The product knew what it was, and the team knew why it mattered.

Capacity is mechanical and mental strength is adaptive, but purpose is emotional. It's fuel, which is why it matters what you're building strength for. You can build a massive work capacity and still burn out if you're not connected to what it's in service of. Even strong people lose their way when they forget why they're moving in the first place. The question isn't only whether you can go further, it's why you would.

Ask any seasoned lifter what keeps them going and the answers get quieter over time. It isn't the meet or the total, it's that the ritual grounds them, makes them better, and reminds them of who they are. Ask a product team what keeps them shipping when everything breaks, and if they're still smiling, it's because the mission means something to them. They've felt the user's pain, they've seen the real-world impact, and they've tasted the outcome of building something that matters.

So, what powers you? Not just when things are working and people are watching, but when the bar is stuck, when the sprint is a slog, when the road is long and there's no applause in sight.

That is the kind of test SERE training is designed for. In the U.S. military's Survival, Evasion, Resistance, and Escape course, people are pushed to their psychological limits: deprived of sleep, isolated, interrogated. It is a test of skill, but more than that it is a test of resolve, of remembering the mission when the environment is engineered to make you forget. The ones who endure don't have better gear or more talent. They have clarity, and they know what they're fighting for.

That is your fuel. That is your engine. That is the difference between showing up when it's easy and showing up when it counts.

■■■ CHAPTER 08

08

**DECISIONS ARE MADE
UNDER LOAD**

STRESS TESTS THE SYSTEM

CHAPTER 08 • SECTION 8.1

Stress doesn't break the system. It exposes what was already weak.

In the gym, testing under load is a simple idea. Your ability to move weight when you're tired is the real signal of progress, and every lifter knows it. The same test exists in product leadership, systems design, and incident response, but most of us don't run it until the moment runs it for us.

The Log4j vulnerability in December 2021 made that brutally clear. A zero-day exploit in a widely used Java library allowed remote code execution with minimal effort, and suddenly nearly every organization was asking the same urgent questions:

- Are we exposed?
- Where is Log4j deployed in our environment?
- Do we have visibility into historical access or exploitation attempts?

This was never just a code issue. It was a test of organizational readiness, technical, operational, and strategic all at once. Teams that had practiced incident response, mapped their architecture, and built cross-functional trust could move with purpose. Others stumbled, not because they didn't care, but because they had never trained for the moment.

It was the backup problem, writ large. Many companies back up data religiously, but few test whether they can actually recover it. Fewer still know how long recovery will take, or what their RTO (Recovery Time Objective) or RPO (Recovery Point Objective) really are. The lesson gets learned the hard way, and it is always the same one: backups are only as valuable as your ability to restore fast.

Log4j forced a parallel reckoning. Malicious scanning began months before the public disclosure, but most organizations didn't retain accessible data that far back. They had cold storage, frozen or tiered off to save money, but they had never practiced bringing it back online quickly for an investigation. When the pressure hit, teams had to figure out, often in real time, how to thaw data, rehydrate logs, and search for infection markers across old records.

Some had tested this process before. They knew the commands, the timing, the quirks of their tooling, and they had trained like operators. Others hadn't. Some couldn't search more than 30 days back, and others found that recovering historical logs was so cumbersome it may as well not have existed. Those companies weren't just missing data, they were missing a disaster recovery plan for threat analytics.

At Elastic, the customers who had previously rehearsed these data flows, archiving, restoring, and hunting, were able to quickly triage and verify impact, drawing from months-old telemetry. They weren't just ingesting logs, they were building institutional memory.

That mirrors what elite military units do when they train decision-making under fatigue. In Navy SEAL training or Army Special Forces SERE programs, candidates are made to perform operational tasks after sleep deprivation, cold water exposure, and physical exhaustion, not to break them but to reveal what is already broken. In those moments you don't rise to the level of the manual, you fall to the level of your defaults, and the only way to improve those defaults is to train them, deliberately, under controlled stress.

The industry has lived the same shape since. In February 2024, the Change Healthcare ransomware attack took down claims processing, prescription routing, and billing across most of U.S. healthcare. The vulnerability wasn't novel, but the organizational readiness was. Hospitals that had drilled their incident response could keep dispensing prescriptions on paper, while others lost

weeks to manual workarounds because no one had practiced operating without the platform. Same lesson, different load. Stress finds the truth.

THE 2026 STRESS TEST IS MACHINE-SPEED

The Log4j-shaped stress test was bad. The 2026 version is worse, because the attackers are no longer moving at human speed.

The mean time from vulnerability disclosure to confirmed exploitation has fallen from 2.3 years in 2019 to under one day in 2026. Breakout times, the window between initial compromise and lateral movement, are measured in seconds. Phishing campaigns crafted by large language models hit click-through rates 4.5 times higher than human-written ones, and capabilities that once required nation-state expertise are now available to anyone with an API key.

If you are not using AI to battle AI, you will lose. Defensive AI is the new minimum entry fee just to stay level. There is a whole chapter on AI later in this book, and this is a big part of why it needed one.

STRESS FINDS THE TRUTH

The same test runs in product and platform work. You might have a dashboard for monitoring, a workflow for restores, and a playbook for incident response, but unless you've tested them when it matters, they're just ideas. Stress finds the truth.

So whether you're squatting on trembling legs after five working sets or trying to rehydrate petabytes of logs to confirm an intrusion, the system only works if it works under pressure. This isn't a new idea. I brought it up in Chapter 2 with James Clear's line:

"You do not rise to the level of your goals. You fall to the level of your systems."

Under the weight of stress and urgency, that line deepens. Goals vanish in a crisis and roadmaps collapse under pressure, and what remains is the infrastructure you've trained, tested, and trusted. Whether that's a disaster recovery pipeline, a muscle memory forged in fatigue, or a culture that knows how to move without waiting for permission, it's your system that carries you. Resilience is not something you react your way into, you build it, deliberately, daily, and under load.

CLARITY BEATS CERTAINTY

CHAPTER 08 • SECTION 8.2

You don't need to know the outcome to know how to act.

There's a myth in leadership, and in lifting, that success comes from always having the right answer, that if you just gather enough data, wait long enough, or plan hard enough, certainty will arrive and carry you through. The best teams, the best lifters, and the best products I have seen don't run on certainty, they run on clarity.

You see it in moments of disruption. In early 2020, when the COVID-19 pandemic rewrote every assumption about business, teams that waited for complete information froze. The ones who moved quickly didn't do it recklessly, they did it with intention.

- **Zoom** opened up free access to educators worldwide. Daily meeting participants skyrocketed from 10 million in December 2019 to 300 million by April 2020.
- **Peloton** overhauled its entire supply chain when demand outpaced capacity. By Q4 2020 it reported 232% year-over-year revenue growth and added over 1 million new subscribers.
- **Notion** refocused messaging for the remote work moment. Its user base grew from 1 million to over 4 million in 2020.

None of them knew how long the shift would last, but they had clarity of mission, and that clarity became a compass.

It's the same clarity high-level lifters use when they train with RPE (Rate of Perceived Exertion). Instead of sticking to a fixed number on the bar, they assess how each set feels in real time. On some days that means pulling back to preserve recovery, and on others it means pushing heavier than planned. None of that is guesswork. It's informed adaptation, which is what clarity looks like in action when the conditions keep changing.

This is where the OODA Loop earns its place. We met it in Chapter 1: Observe, Orient, Decide, Act. The point isn't perfection, it's momentum, and you act, assess, and adjust faster than the environment can overwhelm you. The model applies just as well to product releases, user feedback, platform incidents, and organizational change as it does to military operations. You're not waiting for every signal to align. You're moving with awareness, grounded in your principles, and fast enough to respond before inertia sets in. That is where clarity beats certainty, and it's why you don't always need a perfect map if you've trained your compass.

Let's be honest: Agile is a loaded word. Some teams swear by it, others roll their eyes, and more often than not the problem is with the implementation rather than the philosophy. Too many teams have had Agile forced on them by someone who read a textbook but never wrote a line of code. The rituals become rigid, the flexibility becomes performative, and the spirit gets lost in the ceremony.

I'm a firm believer in the Agile mindset, but not the dogmatic, by-the-book version. True agility means responding quickly to new information and iterating with intent, and that only works if the team has clarity. Without it, Agile devolves into a flurry of half-finished tickets, context switches, and directionless pivots. The point was never to abandon focus. The point was to stay mission-aligned, laser-focused on the "why," while remaining flexible on the "how."

Where I most often see Agile fail is when it becomes a cover for indecision, when teams confuse agility with ambiguity, and when the lack of a clear goal gets labeled as "*keeping our options open*." I also see it fail when people demand certainty before committing to action. Even today, with more data than ever before, certainty is rare. We have telemetry, user interviews, funnel analysis, Salesforce records, and analyst feedback, and the decision on what to build next is still more art than science. If there was a playbook to follow, we'd be project managers. But we're product

managers. Our craft isn't perfect foresight. It's translating user pain into progress, surfacing the "why" beneath the "what," and seeing the pattern behind the request.

As Nathaniel Fick wrote in *One Bullet Away*, his memoir about the transformation from Ivy League student to Marine officer leading combat missions in Afghanistan and Iraq:

"Complex ideas must be made simple, or they'll remain ideas and never be put into action."

That's our job. We take everything we know, the signals, the inputs, the intuition, and turn it into action, not after a perfect analysis and not when every detail is known, but when it's time to move. We do that not by being certain but by being clear: clear on the mission, clear on the user, and clear on what matters most right now. In the fog of delivery, feedback, and shifting priorities, the job is not to predict perfectly, it's to steer on purpose. Certainty asks, "Are we sure?" Clarity says, "Here's what we do next."

TRAINING FOR CHAOS

CHAPTER 08 • SECTION 8.3

We don't rise to the level of our plans. We fall to the level of our preparation.

In the last chapter I talked about training the engine, building general physical and mental capacity rather than just specific skills. That alone isn't enough, though. What happens when the plan vanishes, when you're under pressure, short on time, and forced to act without hesitation? That's when preparation has to become instinct.

I learned this firsthand as a U.S. Army paratrooper. Before you ever board a plane, you train on the ground for weeks, drilling every movement until it's embedded: how to hook up your static line, how to check your gear, how to exit, how to land. You jump from towers, you simulate the aircraft, and you practice failure, not because you want it, but because it's coming.

You want to fail when you're four feet off the ground, not 800.

We don't take our first flight until the basics are second nature, because stepping out the side door of a C-130 at 800 feet, in pitch black, is against every self-preservation instinct you have. In that moment you don't want to be thinking through a checklist. You want to be moving. If your main chute doesn't deploy, you have 9 to 10 seconds to respond before impact, and there is no time to think in that window. You just act.

I still remember my first jump: the roar of the engines, the rush of the open door, and then standing up, hooking up, and waiting for the green light. I didn't feel fear and I didn't feel stress. I felt clarity. I knew what to do and I executed, because we had trained for it.

That same mindset exists in the best teams, even in tech. At Netflix, Chaos Monkey was built to deliberately shut down random services in production, so that both the systems and the people would learn to adapt under pressure. They didn't just hope their systems were resilient, they trained them to be, and the results were measurable. Netflix prevented 80% of potential outages through the learnings surfaced by Chaos Monkey and the broader chaos engineering discipline. These weren't hypothetical flaws. They were real vulnerabilities, caught early because someone had the courage to test failure on purpose. That wasn't sabotage, it was preparation. You don't find out whether you're ready in the middle of a real incident, you find out beforehand, if you're willing to simulate the storm.

You see this in sport, too. During the CrossFit Open, athletes receive surprise workouts announced just days before competition. Movement patterns shift, equipment combinations vary, and sometimes it's a short, explosive sprint while other times it's a long, grinding engine test. You don't know what's coming, and that's the point. The unpredictability isn't accidental. It reflects one of CrossFit's founding principles: prepare for the unknown and the unknowable. In real life, just like in combat, product development, or incident response, you don't get a playbook with advance notice. You're asked to perform under pressure, with incomplete information and limited control.

By designing chaos into the format, new standards, awkward movement pairings, strange pacing demands, CrossFit forces athletes to confront not just their physical readiness but their emotional and mental adaptability. The top performers aren't just strong, and they don't just move well. They stay composed when the plan disappears. That's the test, and that's the transferability. The Open doesn't only reward fitness. It rewards clarity under fatigue, pacing under uncertainty, and strategy when the rules shift. The chaos is the feature, not a bug, and it reveals what structure alone can't.

This belongs in the same category as paratrooper training or chaos engineering. You don't need bullets or breakage for chaos to be real, all you need is volatility, pressure, and a demand for action. When that moment comes, the best don't panic. They breathe, they move, and they decide.

I want to pause here and share something personal. I've never claimed to have done the hardest thing in the military. Many others have faced more direct danger, made life-or-death decisions in the field, and carried far heavier loads, and Nate Fick, whose story I referenced earlier, is one of many. But I've also learned that you can't live your life comparing hardships. Chaos shows up in many forms, and every one of us has moments when our training is tested by stress.

For me, that came during my deployments in support of Operation Enduring Freedom and Operation Iraqi Freedom, where I served as an intelligence analyst in two Combined Air Operations Centers, first at Prince Sultan Air Base in Saudi Arabia and then at Al Udeid Air Base in Qatar. My job was to represent U.S. Army interests in daily joint targeting and mission planning, to advocate for the air support our soldiers needed downrange. That meant walking into rooms where I was often the lowest-ranking person present, trying to secure limited airframes for missions that couldn't afford to fail. There were more missions than aircraft. Everyone in the room wanted to help, but everyone had missions to support. The real pressure wasn't the data. It was the conversation, the negotiation, the weight of knowing that if I couldn't make our case clearly, the soldiers downrange might not get the support they needed.

That stress taught me the true value of clarity, not just in numbers but in stories. It wasn't the PowerPoint or the packet that made the difference. It was being able to explain why this mattered, what the risk really was, and who would be impacted if we didn't act. I learned young, and under pressure, how to speak across rank and service, how to translate intelligence into insight,

and most importantly, how to give a shit, loudly, clearly, and with purpose.

I didn't have a name for the motto then. As I shared in the prologue, the words live on the patch of VMM-364, the Purple Foxes, and I would learn the squadron's history later in my career. But under the load of those rooms in the CAOCs, the principle was already running the work.

One of the awards I received, the Army Commendation Medal, noted that I served in multiple roles normally held by ranks far above mine, including as the BCD Intelligence NCOIC (a Sergeant First Class role) and as an Intelligence Plans Officer, a position typically held by a Major. I don't say that to boast. I say it to underscore this: you don't perform under stress unless you care deeply about the mission and the people it impacts.

That lesson stayed with me in uniform, in product, and in leadership. It's not process that drives you when the pressure hits. It's principle, it's preparation, and it's the ability to act with conviction because you know exactly what's at stake. You don't have to be on the front lines to know what chaos feels like. You just have to care enough to move when it matters most.

■■■ CHAPTER 09

09

SHIP IT LIKE YOU SHOW UP

Empathy isn't softness. It's clarity. It's knowing what to say no to.

INTEGRITY IN SMALL THINGS

CHAPTER 09 • SECTION 9.1

How you do the small things is how you do everything.

Greatness doesn't usually show up where we expect it. It isn't built in the spotlight, in PR lifts or flashy product launches, in press releases or headlines. Most of what actually earns trust and builds strength happens quietly, in the warmups, in the follow-through, and in the care that no one notices but you.

From the outside, powerlifting looks simple. There are three lifts, squat, bench, and deadlift, and anyone can walk into a meet and give it a shot. But the difference between showing up and winning has very little to do with size or intensity and everything to do with discipline, and discipline lives in the small things. The lifters who win are the ones who move with precision. The bar comes out of the rack the same way every time, the breath is controlled, the bar path is tight and deliberate, the brace is locked in, and the foot pressure is balanced. And they do it the same way whether there are 135 pounds on the bar or a max-effort attempt. That is where mastery comes from: consistency under load.

Watch Olympic lifter Lu Xiaojun and you'll see it. People celebrate his explosive strength, but what makes him exceptional is his control. Every rep is intentional and every rerack is clean. There is no ego in his movement, only precision, and he lifts like someone who knows that how you finish matters just as much as how you start.

The best product teams understand this too. Anyone can ship a feature, but not everyone takes the time to check whether the error message makes sense, or notices whether the cursor lands in the right input field, or asks if the experience feels smooth or rushed. When someone does, users feel it, even if they don't know

why. It's the difference between something that works and something that feels right.

At GitHub, engineers fix what they call papercuts, the small friction points most people would ignore. They don't wait for permission, they just fix them, and the product feels more thoughtful for it. At Apple, designers obsess over pixels and motion: scroll behavior, bounce physics, shadow softness. Those are the details most people never consciously notice, but they notice how it feels, and that's the point. The little things aren't polish on top of the experience, they are the experience, and that is care made visible.

So why doesn't the most full-featured product always win? Android phones offer more toggles, more options, and longer spec sheets, yet Apple, with fewer features and tighter control, continues to lead in loyalty and user satisfaction. Think back to BlackBerry when the iPhone first launched. *"No one wants to type on glass,"* they said, and they were wrong. The first iPhone didn't have copy and paste, an App Store, or video recording. On paper it looked incomplete, and in practice it felt revolutionary. Apple's teams spent months tuning details most users would never name, like scroll speed, button animation timing, and the physics of how things moved on screen, and they did it for the experience, not for the demo. Other companies added features. Apple focused on how it felt to use.

BMW takes a similar approach. They don't sell the highest horsepower, they sell the experience of driving: the way the wheel feels, the way the chassis responds. It isn't only what the car can do, it's how it makes you feel while doing it. Great products don't win because they have the longest list of features. They win because they have been shaped by people who care about every detail and obsess about the mission.

That mindset shows up outside of product and sport too. John Cena, before the fame, was a regular at Gold's Gym. He trained hard, but that's not what stuck with people. What they remember is that he re-racked every plate, wiped down every bench, and left

the space better than he found it, with no cameras and no applause, just quiet respect for the work and for the people who would follow.

You don't earn trust with a launch. You earn it with the work no one claps for. When the moment comes, when the lift is on the platform or the product is in the wild, the real question isn't "*Did it work?*" The question is "*Does this reflect who we are when no one's watching?*"

THE SHIPPING STANDARD

CHAPTER 09 • SECTION 9.2

A clean lift on the platform tells you more than any gym session ever could. You can move big numbers in training, hit personal records, and feel confident under your own rhythm, but step onto the platform at a meet and everything changes. The commands are faster, the lights are brighter, the room is louder, and the pressure is real. Even with the same weight on the bar, your form starts to slip, not because you lack strength but because you didn't train for that moment.

Building is like training. Shipping is competing.

Competing demands more than power. It requires control, presence, and precision when the world is watching, and it introduces more variables than training ever does. In the gym you control the pace, the setup, and the rhythm. On the platform you might face a cold bar, unfamiliar flooring, a tight timeline, or commands that arrive quicker than you expected.

Production is the platform. In development, teams test the happy path, and in production users rarely follow it. They skip steps, input bad data, use features in ways nobody planned for, and still expect everything to work. None of those edge cases are theoretical. They are the job, and they are the difference between building in private and shipping in public. That is what it means to compete.

At Netflix, shipping is part of every step rather than something saved for the end. Engineers own their code from the first line to long after it's live, they test it, monitor it, tune it, and fix it when needed. There is no handoff and no deflection, because accountability is shared. Staging environments mirror production closely, simulating real user behavior and traffic patterns, because Netflix teams know you can't expect consistent

performance unless you train in the conditions you'll actually face. What they celebrate is readiness before a failure, not heroics after one, and that is how they keep quality up under pressure.

Shipping is a team sport, and the teams that win align around a shared standard of care. You see that same commitment at NASA. Before every launch they hold a Flight Readiness Review, where each subsystem lead, whether in engineering, mission ops, safety, or comms, walks through their area of responsibility and gives a go or no-go decision. If even one person says no-go, the mission halts. There is no debate and no pressure to push through, just a clear respect for the standard. When the risks are that high, trust gets built on preparation, discipline, and the shared courage to pause until it's right, not on optimism.

THE DAY THE STANDARD HELD

That is the standard we held ourselves to before our biggest deployment. In July 2016, our agent, the product we had spent six months rewriting from the inside out, went live for Red Flag at Nellis Air Force Base. My engineering lead and I stood silent on the floor of the Combined Air Operations Center as the exercise started, the same scene I described in the prologue. Pilots were in the air, controllers were guiding them, and air defense was tracking them. A crashed laptop in a startup is annoying. A crashed laptop in that room is a different category of problem.

There's a saying in these exercises: *it's more fun to be a pirate than to be in the navy*. The red team, the adversaries, always have the upper hand, because they only have to be right once, while the defenders have to be right twenty-four hours a day, seven days a week. In 2016, the blue team and our agent changed that.

The exercise ran through, the teams reported no issues, and the system held. Then the red team came back and asked us to turn down our protections so they could continue to train. That is the greatest honor a defender can get in these exercises: the pirates had been forced to ask permission. One of our operators earned

an award from the exercise commander for performance under load.

We didn't get applause for the rebuild that made it possible. We got something better, the trust to be there next time. That is the shipping standard. It isn't what you ship, it's who you are when it goes live.

EVEN WHEN THE LIFT DOESN'T LAND

Even with all that care, sometimes the lift still doesn't land. In powerlifting you might feel like you hit a perfect rep, and the judge flashes red anyway. Maybe your depth was just short, maybe the lockout wasn't fully controlled, maybe you rushed the pause. The judge doesn't grade your effort, only your execution. You don't get to argue with that, you adjust. The best lifters don't spiral when they miss. They listen, learn, and step back on the platform with more precision than before.

The same thing happens after a release. You might ship something you believe in, only to hear that it confused users or didn't work the way you expected, or that the problem it solved internally doesn't translate outside the building. That isn't failure, that's feedback, and the only real failure is refusing to respond to it. The best teams are not perfect, they are resilient. They listen to the signals, respond with care, and ship again and again with more awareness every time.

We've all seen what happens when something goes out just to meet a deadline. Corners get cut, quality drops, bugs slip through, and the follow-up work takes longer than doing it right would have in the first place. Users notice. That isn't shipping so much as recovery.

A real shipping standard doesn't ask you to move slowly, only to move with intention: the checklist exists before the pressure hits, the dry runs happen before the launch, and everyone knows what "ready" actually means, which is not just functional but finished.

Your standard is your signature, and if you wouldn't sign your name to it, it isn't ready.

Lifting the weight is only part of the story. Anyone can move it once, but the lifter who shows up, hits depth, follows the commands, and finishes clean is the one who earns respect. Product works the same way. You earn trust by shipping something you would stand behind, not by shipping something big, and that is why elite teams don't rush. They prepare. As the United States Marine Corps teaches:

“Slow is smooth. Smooth is fast.”

There is no hesitation in that line, only precision under pressure. You train the way you want to perform, and you ship the way you want to be trusted. Speed without control leads to chaos, but when you move with purpose, readiness compounds into confidence, and that is the kind of momentum you can build on instead of scramble after.

EVERYTHING BUILT IN

CHAPTER 09 • SECTION 9.3

At the highest level, strength is total integration rather than brute force: each breath, angle, and cue refined until nothing is wasted. Lu Xiaojun isn't dominant because he trains harder, he's dominant because his training is complete. His grip, his breath, his core, and his positioning are aligned, there is no wasted motion, and every part of his movement supports the next. He is strong, but more than that, he is unified.

Product teams face a similar challenge. It's easy to chase what's next, the shiny feature, the headline for the release notes, but when something new is added without regard for the whole, it often unsettles more than it improves. Instead of adding value it reveals what's missing, and instead of delighting users it creates friction in places that once felt natural. That is why product managers need to pause, not just to evaluate whether something can be built but whether it belongs. Does it complete the user's experience? Does it connect meaningfully to the rest of the platform? The goal is bigger than delivering functionality. The goal is for everything in the system to make more sense because that thing is there.

Lu doesn't just train the bench press. He trains the setup, the position of his feet, his breathing under load, and his recovery, because strength alone doesn't make a champion. What matters is the integration of every part, and product deserves the same treatment. A new feature can introduce more problems than it solves if it isn't thought through as part of the whole, so PMs need to step back and evaluate not just the capability, but the completeness of that capability across the entire product suite. That completeness is what creates trust.

One of the clearest illustrations of this lives far from software, in a hospital. At Great Ormond Street Hospital in London, a pediatric

cardiac surgery team noticed something troubling. Their operations were among the best anywhere, but the handoff from surgery to intensive care, the most critical moment of all, was prone to error: equipment delays, missed steps, unclear roles. Despite skilled professionals and excellent tools, the system itself wasn't working.

To solve it, they looked beyond healthcare and studied the Ferrari Formula 1 pit crew. In an F1 race a pit stop lasts seconds. Tires change, fuel flows, adjustments happen, all with zero confusion, because the choreography is clear, the roles are defined, everyone knows their job, and every motion supports the next. The hospital team brought in Ferrari's pit crew to analyze their process, and inspired by what they saw, they adopted similar principles: clear roles, repeatable sequences, coordinated language. They didn't add more people or machines. They built better integration, and the result was fewer errors, faster transitions, and stronger outcomes, not because they moved faster but because they moved together.

That kind of completeness is rare but unmistakable, and Fred Rogers understood it deeply. His television program wasn't flashy or fast. It was thoughtful, quiet, and purposeful, and from the music to the pacing, from the way he entered the room to the way he asked questions, every detail was considered. Nothing was accidental, and everything contributed to the experience of a child feeling seen, safe, and understood.

Mr. Rogers didn't ask how to entertain children. He asked what they needed, and he aligned his words, his tone, and his format with the emotional weight of that need. He didn't simplify to the point of distortion, he clarified. He built trust by being consistent, and he built it in Pittsburgh.

Completeness is a standard, not a checklist. You feel it in a product that anticipates what you need, you see it in a lifter whose movement is so fluid it barely looks like effort, and you experience it in a team that moves with confidence because nothing is missing. But completeness doesn't begin with

execution, it begins with empathy. The best teams do not just ask what they can build. They ask what someone is trying to accomplish, they understand the pressure, the environment, and the mission that lives outside the interface, and they recognize that a feature is not just code. It is part of a system meant to help someone do something that matters.

Empathy isn't softness. It's clarity. It's knowing what to say no to. It's designing for the full context of the user's day, not just the ideal case in a wireframe, and it's building for the hard path as well as the happy path. Fred Rogers delivered care, not entertainment, and he didn't just talk, he listened. That is what the best products do. They understand people instead of overwhelming them, and they earn trust instead of competing for attention.

What *complete* means is changing in 2026, because AI is shifting the interface layer itself, and I'll come back to that in the chapter on AI.

EVERYTHING BUILT IN

Completeness is what makes a system strong, and it is what people come back for, not because it does everything but because it does the right things, completely. Everything built in. Nothing in the way.

■ ■ ■ CHAPTER 10

10

THE TEAM IS THE TOOL

SPOTTERS SAVE MORE THAN REPS

CHAPTER 10 • SECTION 10.1

Spotters look like the quiet people standing behind the bench or beside the squat rack, waiting for something to go wrong, but there is a lot more to the job than that. A good spotter is a safety net if a lift fails in a way that could hurt you. They are a second set of eyes on your form as it starts to break down. They are the source of the small cues, right when you need them: *“tighten up,” “drive through.”* But the heart of the job is restraint. A spotter gives you just enough help, and often none at all, so you can push yourself safely and build strength that is actually yours.

“A spotter’s purpose is to help you lift, not to lift for you.”

The best peer reviews work on the same principle. When a teammate reviews your code, your design, or your plan, they are not there to rewrite it. They are there to catch what you missed, point at the risks, and offer an angle you had not considered. A good review leaves the author better equipped to own the work and improve it, not dependent on the reviewer to fix it. The best reviewers, like the best spotters, pay close attention the whole time and keep their hands off until they are needed.

User feedback should act like a spotter’s cues too. Engaged users tell you what is confusing, what they love, and what is missing, and that tells you where to focus. What they do not do is dictate the solution. They guide the decision with their lived experience, and the decision is still yours. Lean on user feedback as a script and you lose your strategic intent. You become the lifter who expects the spotter to lift every rep, and you stop growing.

The same goes for the boardroom. I do not go into a major strategy session or an executive presentation cold. I run the

documents past colleagues I trust, and I dry-run the meeting to find the hard questions before someone senior asks them. That is spotting too. The spotter's goal is the safety and growth of the lifter, not their own performance, and the same is true of the colleagues who review your work. Skip the spotters and rush in unprepared, and you have dropped the weight in front of your peers. You overlook a key stakeholder's concern, fumble a critical metric, or never get everyone aligned on the goal.

The risks are real in both places. A near-max squat without a spotter or safety pins is how people get seriously hurt. Shipping straight to production without a second set of eyes is how bugs, security flaws, and things you simply did not think of slip through. Even alone, you can set up spotter arms or safety straps in the gym, and linters and automated security scans in software, to catch a failure before it does damage. Those tools do not replace human judgment, they add a layer of resilience underneath it.

In security this watchful role gets active, even adversarial, in red, blue, and purple team exercises. The spotter there is not standing quietly by the rack. Red teams attack assumptions and infrastructure to expose weaknesses. Blue teams defend and shore up what gets found. Purple teams combine both so the learning happens faster. Spotting becomes deliberate stress, so the team gets stronger and smarter before a real adversary shows up to do it for them.

So how do you become a better spotter, in the gym, on your team, or in the boardroom? Stay attentive, give clear feedback at the moment it is useful, and resist the urge to take over. You are not there to lift the weight, give the presentation, or write the feature. You are there to assist, to protect, and to create the conditions for someone else to succeed. Great spotters know when to speak up, when to stay silent, and how to encourage without undermining. It is the same discipline I described earlier in product management: define the why, not the how, and let engineering find solutions you never would have instead of trying to do the lift

alone. Above all, great spotters listen, because knowing what someone needs in the moment is the difference between helping them grow and accidentally holding them back. Listening, as a skill and as a form of strength, is what the next chapter is about.

TRUST IS A SHARED PR

CHAPTER 10 • SECTION 10.2

In powerlifting a personal record, a PR, gets celebrated by more than the lifter. The spotters, the coach, the training partners, everyone who corrected a form cue or simply showed up on a bad day owns a piece of it. Trust grows strongest in those moments. The lifter knows they could not have done it alone, and the people around them feel ownership in it. A shared PR is a shared story, and that story is what bonds people together and makes them eager to keep showing up for each other.

Product teams forge trust the same way. When a team wins together, landing a major customer, getting through a critical outage, shipping a complex feature, that shared achievement becomes the foundation for deeper collaboration. Trust grows not out of individual heroics but out of people watching each other invest, struggle, and succeed side by side. Shared PRs at work are more than milestones. They are the reminder that we are stronger as a team than we will ever be as individuals.

A personal example comes from working alongside my former engineering peer, Tony Meehan. We had a strict rule when communicating to the team: never use I statements. Our reasoning was simple. There was nothing we accomplished in that job that was done alone, so saying “*I did this*” or “*I fixed that*” was incorrect. Everything became “*we*” or “*the team*,” even in small wins. We also made it a habit to take blame when things went wrong and defer credit when things went right. This simple discipline created a culture of shared ownership, where trust was built through consistent signals that no one succeeded or failed alone.

That mindset is how we built an endpoint at Endgame that could go head to head with anyone in the market. We shared the mission, the credit, and the responsibility with everyone involved.

We never pretended that the leaders single-handedly made it happen, because we are only as strong as our team. The real job of a leader is to clear the path for the team's success, remove the obstacles, and make sure everyone can do their best work.

That was the heart of what Nate meant when he called us an elevator asset company back in the first chapter. Our mission was never to build products for our resumes. It was to lift others, users, teammates, and the organization, so they could rise higher. Every decision, every feature, every fix was grounded in the belief that we succeed only when we help others succeed first.

When I entered the world of competitive powerlifting, I was intimidated. I was surrounded by people stronger than me, lifting far more than me, and for much longer. I expected to be mocked or ignored because of my starting lifts. It was the total opposite. The whole community celebrated every lift, no matter the weight, because they were there for the love of growth. That experience settled it for me: real strength lifts others.

“True communities of strength do not measure value by the weight on the bar but by the willingness to show up, put in the work, and support each other along the way.”

The best teams cover each other's weaknesses and amplify each other's strengths. The best leaders know their own gaps and deliberately build teams that fill them, challenge them, and make everyone better. Abraham Lincoln famously surrounded himself with people who disagreed with him. He understood that real leadership does not fear dissent, it uses dissent to sharpen decisions and widen the view. I have made the same practice part of how I build teams. I have also been on the other side of it.

When I joined Elastic after the Endgame acquisition, I came from a classic endpoint enterprise model where everyone charged per endpoint deployed. That was the industry standard. Elastic leadership was adamant that endpoint security should fold into Elastic's consumption pricing, eliminating per-endpoint pricing entirely. I disagreed, based on my years in the classic space. My

bias was rooted in my experience, which is exactly the kind of bias this book has been warning about.

I listened. I aligned. The shift turned out to be a massively positive move. We saw instant growth in endpoints under management, and we had users tell us, *“Wait, I just get the endpoint too? For what I’m already paying?”* as part of their existing Elastic spend. The leaders I have learned the most from were the ones who insisted on being told they were wrong. That is the kind of decision I am proud of, the kind I was wrong about first.

Weak leaders hire yes-men and cling to their authority, afraid of being replaced or overshadowed. Greatness comes from wanting your team to be better than you and helping them grow past what you could ever do alone. That is real leadership: creating an environment where other people succeed, thrive, and carry the mission forward stronger than you could on your own.

I see the same thing every time I coach. I help lifters who can move more weight than I ever will, and I love it. There is no jealousy in their success, only pride, and their growth does not diminish me, it fulfills me. That is the joy of building strength in other people, watching them do things they once thought were impossible. Great leaders carry that mindset into every team they build, knowing their real legacy is not what they personally accomplish but what they enable others to do.

Yet a lot of organizations erode this trust without meaning to, by rewarding only the person who lifts the heaviest: the loudest voice in the meeting, the contributor who works unsustainable hours. The same mistake shows up in executive bonuses tied solely to short-term metrics and in exclusive club trips awarded to individual sales reps. They are meant to motivate, and what they build is a culture of isolated effort, where teammates compete for personal recognition instead of collaborating for shared success. It is a lifter chasing PRs without ever spotting anyone else, focused entirely on their own numbers while the team stagnates around them.

Building a culture of shared PRs means celebrating contributions at every level: the engineer who asked the critical question in a design review, the product manager who got the stakeholders aligned, the customer success team that surfaced the insight that changed the roadmap. When we recognize that each lift, each launch, and each success came from collective effort, the spotlight moves from individual ego to shared mission.

Trust grows fastest in tough moments. When mistakes happen or plans fall apart, how the team responds decides whether trust is built or broken. Blame creates distance, while honesty, accountability, and a commitment to move forward together deepen trust and keep the team resilient. Shared PRs are not only about winning, they are also about recovering and learning side by side. Leaders who highlight team wins, acknowledge the behind-the-scenes work, and remind everyone that no victory is a solo achievement build cultures where people feel seen and valued.

I do not believe in the myth of the single person shaping the world. The stories told about Musk or Jobs usually skip over the teams of brilliant designers, engineers, and product managers who imagined, built, and refined what those leaders presented. Apple's iconic products were crafted by extraordinary groups whose work was brought to Jobs, not invented solely by him. Musk has made careers out of buying other people's visions and marketing them as his own. Ego has no place in product management. Our role, as I said to Tony often at Endgame, is to take the blame when things go wrong and defer the credit when things go right. No single person defines a product or a company, and anyone who claims otherwise has a personal reckoning they need to face.

Real strength, real leadership, and real success come from recognizing that we only reach heights worth celebrating by lifting each other.

THE TOOL YOU INVEST IN

CHAPTER 10 • SECTION 10.3

Every lifter knows that tools matter. A barbell with tight tolerances, smooth bearings, and well-kept knurling does not just make lifting more enjoyable, it makes it safer, more effective, and more consistent. Good equipment is about performance and longevity, not appearances. Neglect your tools and you get unpredictable outcomes, unnecessary risk, and wasted effort.

The same is true of building products and teams. The most important tool you will ever invest in is your people. Yet in too many organizations, especially the ones led by egocentric founders or executives, the energy goes into a cult of personality instead of into the team that actually delivers. These leaders chase personal brand moments, the keynotes, the interviews, the social media spotlights, while their people go without resources, watch priorities shift under them, and guess at the goals. A company like that is not built to lift everyone up, it is built to keep one person at the top.

WeWork under Adam Neumann is the prime example. Neumann's obsession with his personal image and his extravagant lifestyle overshadowed the needs of the company and its employees. His behavior bred chaos and instability and ended in WeWork's spectacular collapse. Thousands of workers and investors got hurt because they had trusted the vision of one person rather than a strong team.

I preach the complete opposite. Our job as leaders is not to cultivate an image of ourselves as saviors or visionaries but to clear the path so our teams can do their best work, remove the obstacles, and set people up for success without making ourselves the story. A leader who needs to be the hero will always trade team health for personal glory, and a leader who makes the team the hero builds strength that lasts.

Then look at Microsoft under Satya Nadella. He moved the company away from internal politics and combative silos and toward a culture of empathy, shared success, and growth mindset, and a stagnating giant became one of the most innovative and collaborative companies in the world. His investment in people became Microsoft's most powerful tool, and it brought back both morale and performance.

The investment is not complicated, and most of it is small. It is the one-on-one that goes past the status update. It is the career conversation that matches what someone actually wants with what the organization needs. It is honest encouragement when someone steps up to a hard problem. None of it looks like much on its own, any more than oiling the bearings on a barbell or checking the safety pins does. It adds up to a culture where people believe they can perform at their best.

When you do not invest in your tools, or your team, things break. People leave, quality drops, and trust erodes. Frustration festers when problems get ignored or when people are treated like cogs instead of craftspeople. The team goes brittle and cannot adapt when the stress goes up. Over time, like a neglected piece of gym equipment, it becomes unsafe and unreliable.

The best leaders I have worked with treat the team itself as the ultimate tool. They invest ahead of the need: learning, mentorship, collaboration rituals, mental health support. They advocate for their team's needs with the same urgency they would bring to a broken production system. They know an investment in people pays back in creativity, resilience, and performance that holds up over time.

And they know the investment never ends. A well-used barbell needs regular maintenance, and people need consistent care. The strongest teams I have seen were not built by one-time efforts or flashy perks but by steady, thoughtful attention that left every member feeling stronger, safer, and more capable.

Empathy is at the heart of great product management. We spend our days listening to users, understanding their pain, and building things that make their lives better. Too many of us forget that empathy has to start with our own teams. The same patience, curiosity, and care we give customers should shape how we support the people we work beside every day. Point empathy outward to users and inward to the team at the same time, and you get a culture where everyone feels seen, valued, and motivated to do their best work.

“Titles do not matter. Relying on explicit authority, your rank, your title, your power over someone’s paycheck, reveals weakness, not strength.”

The strongest leaders do not force anyone to follow them. They build an environment where people want to follow, because they trust the mission, believe in the work, and feel supported in becoming their best. That is implicit authority, the quiet confidence you earn by consistently empowering others. It is the difference between a boss people fear and a leader people choose.

I saw this firsthand in the US Army. The people who demanded respect purely on rank were usually the ones who deserved it least. Leaders like Nate Fick inspired teams who wanted to follow them into battle. Not because they had to, but because they believed in the leader, the mission, and each other.

WHEN AI JOINS THE TEAM

The team is changing in 2026. AI agents are teammates now. They draft, summarize, prototype, prioritize, ship, and, more and more, decide. You manage them the way you would manage any direct report: a clear mission, honest feedback, and real ownership when something breaks. The team is still the tool. The tool just got bigger. I will come back to this in the chapter on AI, because it deserves more than a paragraph.

The strongest teams are not defined by the brilliance of a single person, or the cleverness of a single model, but by how fiercely they lift each other, day after day. When we invest in people with patience and purpose, we build not just products, but missions worth believing in.

... CHAPTER 11

11

STRONG ENOUGH TO LISTEN

The hardest lift you will ever make is putting your ego down.

LISTENING AS LEADERSHIP

CHAPTER 11 • SECTION 11.1

In lifting, the strongest athletes don't just follow cues, they go looking for them. They want feedback on form, timing, and control, because they understand that every correction is a chance to get better. That hunger doesn't stop at the gym doors. The best leaders have the same mindset: they don't listen so they can reply. They listen so they can understand.

Listening starts with actually being there. It is easy to nod along while you plan your response. Every leader does it, and every leader who says they don't is doing it right now. The listening that changes anything happens when you quiet your own thoughts long enough to hear what the person across from you actually needs. It might be a training partner describing something that feels off under the bar, or a teammate raising a concern in the middle of a sprint. Either way, the act of listening says: *I value you, and I value what you see.*

We've all dealt with someone who claims to want feedback and then argues or shuts down the moment they get it, right? Or worse, nods along while rehearsing their rebuttal. In lifting, those athletes plateau or get hurt. In leadership the consequences are subtler but just as damaging: honesty fades, the same mistakes repeat, and new ideas stop showing up.

When people decide their leadership won't listen, or watch their feedback get ignored a few times in a row, they stop engaging. Leadership becomes something to avoid rather than something to trust. A conversation with a manager starts to feel like a tax on progress instead of a path to improvement. Silos form as people retreat to wherever they feel heard, or at least left alone.

Feedback exists for a reason. It is an outside perspective on the things we cannot see ourselves. Day after day, stuck in our own

heads, we reinforce our own ideas, and some of them are bad ones. Without somebody on the outside telling us, flaws harden into habits.

But feedback has to be given responsibly too. Some people use “*feedback*” as cover for being cruel or condescending. Good leaders know that useful feedback is clear, aimed at the action rather than the person, and delivered with the intent to build rather than break. It is the difference between saying “*You suck at this*” and “*You could improve by keeping your elbows tighter during the press.*” The first one deflates somebody. The second one gives them something to do on the next rep.

Earlier in the book I talked about product managers getting lost in tactical execution and missing the bigger picture of the workflow or the user journey. The same thing happens under the bar. You can obsess over the sticking point in your press and never notice that your bar path has been drifting forward the whole time. Stepping back and welcoming constructive feedback is what breaks through those blind spots.

Listening also creates psychological safety, and I have never seen a high-performing team that didn’t have it. When people know their ideas and their fears will be heard without judgment, they stop guarding their words and start telling you the truth. That candor is what innovation and resilience grow out of.

Leaders who listen multiply their own perspective. They get dozens of lenses on the mission instead of one, and none of it happens passively. They ask clarifying questions, they invite dissent, and they understand that the best solutions rarely come from a single voice. They come from many voices shaped into one direction.

And just as a lifter has to listen to their own body, leaders have to listen to themselves. Noticing fatigue, frustration, or ego creeping in is the first step to recalibrating. It is leadership turned inward, staying aware of the signals that could compromise a decision or derail the momentum of the team.

“Most people do not listen with the intent to understand; they listen with the intent to reply.” — Stephen R. Covey, *The 7 Habits of Highly Effective People*

There will also be days when you screw up. Not every meeting, Slack message, or email is going to land, because you're human. Part of being a good leader is accepting that, taking responsibility for the mistake, and being transparent with your team when it happens. Saying something like *“Yesterday I didn't give you enough time to clearly make your point. I'm sorry. Can we continue the conversation?”* shows strength, not weakness.

Just as empathy is not a sign of softness, openly owning your mistakes builds trust and models the behavior you want from your team. Too many leaders cling to the idea that they have to stay up on a pedestal, and they mistake authority for respect. These explicit-authority leaders demand deference without earning it, forgetting that respect is given when it is first shown. We are all human. Titles are made-up constructs.

Be a human, don't be an asshole, and you'll be amazed at how well your team can operate.

Listening as leadership is a daily discipline. It takes humility, curiosity, the courage to act on what you hear, and the wisdom to give feedback that lifts people up instead of tearing them down. It is the difference between a leader who demands compliance and one who inspires commitment, and between a team that survives and one that thrives.

LISTENING BETWEEN THE LINES

CHAPTER 11 • SECTION 11.2

Good leaders listen to the words, and great leaders listen past them, because what people say rarely tells the whole story. The subtext often tells you more than the words do: the hesitation in a voice, the glance across the table, the silence after a loaded question.

In lifting, an athlete might tell you they're fine while shifting around uncomfortably under the bar. You can hear it in their breathing, see it in a setup that wavers, or sense it in the way they rack the bar with relief instead of resolve. A coach who misses those cues either pushes an athlete toward an injury or lets a lack of confidence fester unaddressed.

The same thing plays out at work. A teammate says *"I'm good with this plan"* while their tone flattens or their posture closes off. They contribute less in meetings, and their messages get shorter and less engaged. Those are signals a leader has to learn to read, because they're the early warnings of misalignment, burnout, or resentment starting to build.

Listening between the lines is not mind-reading. It is a set of techniques called active listening that help you tune into more than the words:

- **Observe nonverbal cues.** Pay attention to body language, facial expressions, eye contact, posture, and gestures. Discomfort, stress, or disagreement often shows up physically before it's spoken.
- **Reflect and paraphrase.** Repeat back what you heard in your own words. It shows you're tracking, and it gives the other person a chance to clarify or expand. For example, *"So you're saying the timeline feels tight, but you think it's still doable?"*

- **Ask open-ended questions.** Questions like *“How do you feel about this approach?”* or *“What would you change?”* invite honest responses and help surface unspoken concerns.
- **Pause intentionally.** Silence can feel uncomfortable, but giving space after someone speaks often encourages them to share more, especially when they sense you’re patient enough to truly listen.
- **Listen for tone and pace.** Speeding up, slowing down, or changes in pitch can signal anxiety, excitement, or doubt.
- **Eliminate distractions.** Close your laptop, put your phone away, and make eye contact. Active listening demands full presence, and split attention sends the message that what they’re saying isn’t important.

These techniques help you catch the gap between the words and the intent. That gives you a much clearer picture of what your team needs.

None of this is theoretical. When Alan Mulally became CEO of Ford in 2006, he started “Business Plan Review” meetings where executives reported on their areas with green, yellow, or red indicators. Ford was losing billions at the time, and at first everyone reported green anyway. Mulally noticed the nervous laughter, the fidgeting, and the avoidance, clear signs that people were afraid to share bad news. He called it out. The next week an executive showed a red indicator. Mulally praised the honesty publicly, and the culture of fear broke almost overnight. He read the gap between what people said and how they behaved. That changed Ford’s culture, surfaced the real problems, and helped the company avoid bankruptcy without a government bailout.

A similar lesson comes from the boxing ring. During the 2020 fight between Deontay Wilder and Tyson Fury, Wilder’s corner threw in the towel in the seventh round even though Wilder insisted he wanted to keep fighting. His coach, Mark Breland, saw the subtle signs: Wilder’s legs were unsteady, his reflexes had dulled, and his punches had lost their snap. Those were clear

indicators that he was in real danger. Breland's choice was controversial, but many praised him for protecting Wilder from a potentially devastating injury. He acted on what he saw, not just on what his fighter said, and put the athlete's long-term health ahead of pride in the moment.

When you can spot misalignment early, you can address it before it turns into conflict or disengagement. When you can spot uncertainty, you can offer clarity. And when you show someone that you see past their words, you prove you care enough to truly understand them.

AI can hear what gets said. It cannot hear what gets meant. I will come back to that gap in the chapter on AI.

THE EGO LIFT

CHAPTER 11 • SECTION 11.3

Some leaders believe the biggest threat to success comes from the outside: competitors, market shifts, resource constraints. I think the greatest danger to a team is usually internal: an unchecked ego at the top. Ego convinces leaders that they alone have the answers, blinds them to new information, and makes them resistant to change. It turns what should be a shared mission into a personal crusade and suffocates the creativity and collaboration a team needs to adapt.

The ego lift shows up when a leader believes their title grants them absolute knowledge, or when an athlete refuses coaching because they're sure they know best. Those moments look like confidence, but they're insecurity dressed up as bravado, and they poison teams faster than almost anything else.

Listening doesn't work when ego is standing in the way. A leader might nod along waiting for their turn to speak, or worse, interrupt to redirect the conversation back to themselves. Either way the effect is the same: people stop sharing, meetings become performative, feedback withers, silos grow, and the whole organization slows down.

This is the dark mirror of what I described at the end of the last chapter. I mean the leaders who claim they alone have the vision and force alignment through dictation instead of inspiration. They believe respect comes from authority rather than credibility. These explicit-authority leaders declare a path without inviting any discussion, and they mistake fear for alignment. Under that kind of command, teams comply on the outside while disengaging on the inside, working to avoid conflict rather than to achieve anything great.

It's the leadership equivalent of "*because I said so.*" Seniority doesn't always mean smarter. Experience brings real insight and intuition, but it is not infallible, and a fresh perspective can break a stale pattern. The surgical teams who learned patient handovers from Formula 1 pit crews saved lives because the mission mattered more than their egos.

Leadership also never stops changing, so it demands continuous learning. In *What Got You Here Won't Get You There*, Marshall Goldsmith describes how the traits that once fueled a leader's success can turn into blind spots if the leader fails to grow. Markets change, requirements shift, and what worked in a previous era cannot simply be applied wholesale to new problems. Those past lessons are still critical for growth, they just need to be treated as guides rather than rigid blueprints.

The founder's dilemma captures this perfectly. Founders are often great at the vision, the hustle, and the risk-taking it takes to start a company. As the organization grows, though, the same command-and-control habits or unstructured creativity that fueled the early wins can become obstacles. The company starts to need process, delegation, and collaborative leadership. When founders cling to the old ways, convinced their instincts alone will scale the business, they risk undermining the very mission they set out to achieve. The founders who make it through recognize the shift and evolve. They seek out mentors, build diverse teams, and accept that their role has to change if the company is going to thrive past the startup stage.

When everyone agrees the mission is the most important thing, these decisions get easier. Reaching out for help or inviting a different viewpoint is the obvious choice when it serves the mission. People who won't listen or won't try are usually acting from fear. More often than not it's a personal agenda driving them, not the team's success. Product management has no place for ladder-climbers or title-chasers. The mission must come first, and when it is your guiding light, every other decision becomes clearer.

When a team truly cares about the mission, ego fades. In a satisfying paradox, personal success tends to follow anyway, as a symptom of the mission's success.

The hardest lift you will ever make is putting your ego down.

The strongest teams are led by people who do not let their ego, their vanity, or their fear get in the way.

■■■ CHAPTER 12

12

**THE WEIGHT IS REAL. OWN
IT.**

DON'T DODGE THE HEAVY SETS

CHAPTER 12 • SECTION 12.1

The heaviest sets in the gym teach you what you're made of. Your technique frays, your breathing shortens, and every fiber of doubt tries to talk you out of the next rep. But if you dodge those sets, if you forever add weight "*next time*" or cut the range of motion when it gets tough, you never find the limits you're capable of surpassing.

The night before a big lift has its own ritual. I scan tomorrow's workout, see a 1RM attempt or a set taken to true zero Reps in Reserve sitting there, and feel the nerves and the excitement arrive together. Those are the days you celebrate the grind, the day-to-day discipline that built your capacity. The moment the bar bends under load is your chance to prove how far you've come. When you finally log that PR in your fitness app, it's more than a number. It's evidence of your commitment, and it's the right to earn a well-deserved deload.

Product work has its heavy sets, too. The planning sessions, the heated debates over priorities, the painstaking designs, all of it culminates in one make-or-break moment: the release. When the new feature goes live and real users experience your work, it's the equivalent of stepping onto the platform. The high isn't only about shipping, right? It's every rep of preparation paying off at once, the point where your investment meets reality.

One of my favorite parts of being in product management is visiting my users. My career has been spent building cybersecurity software, but before that, I was a defender who relied on those very tools to protect my teams. That experience infused me with deep empathy for the difficulty of the job, the importance of effective tools, and a healthy resentment for the snake oil promises that plague our industry.

Every time I step on site at a customer's Security Operations Center, I get a mini-experience of my old life. For those few hours, I live in their shoes, seeing the threats they face, the urgency they feel, the challenges that keep them awake at night. I love being in the fight with them, brainstorming new ways to integrate with the rest of their stack, and, most of all, witnessing the moment when what we built helps them win. When their mission succeeds, it's proof that every heavy set was worth it. Their mission becomes my mission.

It's tempting to skip the hard work: to avoid deep discovery with customers, to half-heartedly push a feature to "*check the box*," to let organizational friction excuse mediocrity. But every time we dodge the heavy sets, we trade short-term comfort for long-term weakness. We miss the chance to sharpen our instincts, build resilience, and develop the relationships that make real wins possible.

Like hitting a PR at a competition, seeing a user win with our product feels like hitting my personal best as a product manager. Their success is my lift, and the mission we share is the weight worth carrying. The mission doesn't get lighter. Only you get stronger.

THE RESPONSIBILITY TO FINISH

CHAPTER 12 • SECTION 12.2

In strength training, a lift isn't counted until it's locked out, until control is clear, the bar is steady, and the rep is complete. A squat that's buried deep but racked before standing tall, or a deadlift that's ripped off the floor but dropped before lockout, doesn't earn a place on the scoreboard. The intent doesn't matter if the execution isn't finished. The responsibility to finish is about more than effort. It's about seeing your mission through until the work is undeniable.

A product has a lockout too, and I have watched plenty of teams rack the bar early. A brilliant idea or well-laid plan means nothing if it stalls at 90%. Too often, teams sprint through the exciting early stages, the brainstorming, the whiteboarding, the rush of discovery, and then lose steam when the grind sets in. The last mile demands relentless focus on details that don't win applause: validating integrations, testing obscure edge cases, polishing onboarding flows, aligning final documentation, preparing enablement, and making sure stakeholders are ready. These tasks can feel tedious, but they are the difference between a product that earns trust and one that frustrates users.

One of the most powerful commitments I made to myself came when Endgame joined Elastic. I promised I would never stop advocating for our Endgame users. Their mission would stay as critical and as deeply embedded within Elastic as it was before we joined. To Elastic's credit, they readily accepted this challenge. Together, we strengthened our platform until our Endgame customers were not only supported, but measurably better protected than ever before. That was the responsibility to finish in action. The work did not pause at the point of acquisition or integration. We carried it forward until the promise made to users was fully honored.

When a user buys a product you helped create, they're placing their trust not just in the brand, but in you. Not every product carries the same stakes. Misprinted playing cards might frustrate a game night but won't bankrupt a family. In cybersecurity, though, you're building your customers' shield. They rely on your expertise and vigilance to help defend their business, their livelihoods, and the security of the people who depend on them. When you build security tools, you're shouldering part of that weight alongside them. If you let the lift drop before lockout, if you stop short of complete, tested, dependable solutions, you leave them exposed.

It's tempting to skip the late nights of final QA, to brush off corner-case bugs as "*edge scenarios*," to let organizational friction excuse mediocrity. We've already named that trade: short-term comfort for long-term weakness. In a field where real adversaries wait for missteps, that weakness becomes an open door.

WHEN THE AGENT DID THE WORK, YOU STILL OWN IT

There's a 2026 version of this responsibility that the book has been pointing at since Chapter 1, and it lands hardest here. The most dangerous line in any review meeting next year is going to be "*the AI did it*." If you shipped it, you own it. If you signed off on it, you own it. If you let an agent loose in production and didn't read what it was doing, you still own it. AI is a teammate, and like any teammate, it can let you down. The responsibility to finish does not transfer. The model did not ship the feature alone, the model did not pick the customer to deploy to, and the model did not write the contract you signed. You did.

In February 2024, Air Canada's AI chatbot told a grieving passenger that a regular fare could be bought and refunded afterward under the bereavement policy. The policy didn't actually allow that. When the customer tried to claim the refund, Air Canada argued it wasn't responsible for what the chatbot said, because the bot was, in their words, "*a separate legal entity*." The

tribunal disagreed. The airline owned what its chatbot put in writing. A court already disagrees with “the AI did it.” I have a lot more to say about what that means for how we work, and it is waiting in the chapter on AI.

Taking personal responsibility for everything you build is not about perfectionism. It’s about integrity, about knowing that when you commit to finishing, you honor the trust your users place in you. Let that trust drive you. Let it fuel you to embrace their mission as your mission. What you start may inspire, but what you finish defines you. Only when you lock out the lift does your work count.

THE LIFT AND THE LEGACY

CHAPTER 12 • SECTION 12.3

From the outside, both powerlifting and product seem attainable by anyone, and in reality, they are. Anyone can step into either and make an attempt.

However, both require focus and nuance to excel. Minute details like the path of the bar or a user's non-verbal cues separate the truly elite from everyone else. In lifting, a subtle shift in balance or a half-second of hesitation can mean the difference between a successful PR and a missed attempt. In product, a poorly timed question or a missed signal in a customer conversation can derail alignment or cause you to build something that solves the wrong problem.

The barbell is a teacher of both moments and memories. A heavy lift can change your understanding of what you're capable of in a single instant, but the deeper value comes from what that lift means over time. The discipline to prepare, the courage to attempt, and the commitment to finish leave a legacy, not just in your personal record books, but in the culture you build around you. Those who watch you lift learn not just about strength, but about character.

In product work, the same legacy unfolds. Our choices ripple beyond immediate wins or losses. The way we engage with teams, the care we put into the final details, the honesty of our conversations with customers, these moments compound into reputations that either build trust or erode it. When you choose to embrace a user's mission as your own, you send a message: that their success matters, that they are not alone, and that their mission deserves the best you can give.

I've found some of my proudest moments in product come not from flashy announcements or big conference stages, but from

quiet emails and calls months after release. A customer writes to share how what we built helped them solve a problem, achieve a goal, or simply feel heard and supported. Those stories remind me that while our work can feel abstract behind code and roadmaps, it becomes real and meaningful in the hands of the people whose lives it touches. Their victories are our legacy.

But legacy can also turn negative if we forget the responsibility we carry. A lift done sloppily in front of new lifters teaches them that form and safety don't matter. A rushed feature full of bugs teaches a team that deadlines outweigh quality. In both lifting and product, we model behaviors that others will follow. Every shortcut becomes permission for the next person to cut corners. Every moment of excellence sets a standard that raises everyone.

There's a quieter version of negative legacy worth naming, because we've already met it twice in this book. This is the Drift, one more time. We named it in Chapter 1, the slow inversion of mission into metric, the dashboard glowing green while user trust fades red. We met it again in Chapter 6, recovery-shaped, when Evernote drifted away from itself by sprinting without reflection. The version that shows up here is legacy-shaped, and it's the slowest of the three. It looks like wisdom from a distance and feels like steadiness from inside. It's the quiet pull of reputation, of *what worked last time*, of becoming protective of the version of yourself that built the success in the first place. Once the Drift sets in here, it takes a generation to clear. The mission is still the antidote, even now.

The lift and the legacy are inseparable. Every rep you finish, every mission you help complete, contributes to a chain of progress that extends far beyond your time under the bar or your name on the release notes. The hours you spend refining the details, the late nights spent debugging stubborn issues, the patience to listen when it would be easier to assume, these aren't just tasks. They're bricks laid in a foundation others will stand on. Your commitment today makes it possible for someone else to rise tomorrow.

Legacy is not built by a single heroic effort but by the consistency of your care. The lift you grind through today, or the product feature you refine until it sings, becomes part of a culture where people believe in giving a shit because they've seen you do it. The real prize of the mission isn't personal glory. It's leaving behind a stronger, more resilient team, product, and community than you found. And legacy is also about making sure everyone, and I mean everyone, has the same opportunity to excel that you have had. It's about opening doors, sharing knowledge freely, and fighting for a culture where every person has the chance to grow, thrive, and contribute their best.

This is the lift: the act of taking on challenges bigger than yourself, of shouldering weight that matters, of proving what's possible when preparation meets purpose. And this is the legacy: the stories told by those you helped, the culture of excellence you leave behind, and the quiet confidence that what you built will outlast you and keep serving others.

When you step back at the end of your mission, whether it's a lift on the platform or a product release that lands with quiet power, you'll know what it was for. Every rep you finished, every promise you kept, every time you chose the harder right over the easier wrong became part of a legacy worth inheriting. The mission doesn't end when you're done. It lives on through those you've taught, supported, and inspired.

Own the weight. Finish the lift. And leave a legacy that proves giving a shit works.

■■■ CHAPTER 13

13

**AI IS THE NEW OS. THE
MISSION IS THE ONLY APP
THAT MATTERS.**

This is the chapter you have been reading toward, because across the previous twelve chapters AI has shown up at the edges of almost every principle in this book. In Chapter 2 it could do the boring reps for you, though the reps that grow you still belong to whoever shows up willing to feel them, and in Chapter 6 it became the teammate that doesn't sleep, doesn't deload, and doesn't take Q4 off, which made recovery a question of when to walk away from output that is always available. In Chapter 8 it changed what a stress test looks like, from the months-long shape of Log4j to attackers moving in seconds, and in Chapter 10 it joined the team. In Chapter 11 it raised a question we were not ready to answer, whether a tool that can hear what gets said can hear what gets meant, and in Chapter 12 it became the most dangerous line in any review meeting: *"the AI did it."*

This is where those threads converge. It is not a defense of AI or an attack on it. It is an honest test of whether this book's principles still hold when the work itself is changing under our feet.

The motto that runs this chapter is the same one that runs the rest of the book: *Give a shit*. I planted it in the prologue and named its source there, VMM-364, the Purple Foxes, the Marine tiltrotor squadron whose pilots fly CASEVAC into enemy fire to bring wounded troops home. I traced it through Nate Fick at Endgame in Chapter 1, and I lived a version of it in my own Army intel work in Chapter 8. Now I have to test it against the loudest tool of the year I finished writing this book, twice: once under the bar, and once in the boardroom.

AI UNDER THE BAR

CHAPTER 13 • SECTION 13.1

I program with JuggernautAI. It watches my sets, learns from them, and reprograms when it needs to. Fatigue shows up and the plan adjusts. I tweak a hamstring and it backs me off, I hit a PR and it pushes harder next cycle. It is the closest thing to a real coach in your pocket that has ever existed, and it does not lift the bar for me.

That is the part most people miss. They hear “AI program” and assume the work just got easier, when really it got smarter and the responsibility shifted onto the lifter.

The whole system runs on one input: the truth. How many reps did I really have left? Did I actually hit depth, or did I cheat the angle because the camera was off? Did I sleep, or did I tell the app I slept? AI cannot guess. It can only respond to what I tell it. If I lie to the app, the program lies back to me, and if I show up honest, it finds me ground I would not have found alone. That is the trade: AI gives you a coach, and you give AI the truth.

Here is what I have come to believe: AI does not replace the work so much as it exposes the people who were never doing the work in the first place. For years, getting a real strength program meant one of two things. Either you could afford a coach you trusted, who knew your body and would adjust your block when your knee was angry, or you got lucky with a template online and were disciplined enough to follow it without modification. Most lifters never had either. They followed something they read in a forum in 2014, never deloaded, never adjusted volume around life, and trained for years without moving their numbers. They were doing the reps, but they were not really training.

That is the failure AI just removed, and it was a failure of access, not effort. A good AI program is not magically better than a great human coach who knows you, watches you move, and pushes you at the right moment, that is still the best version of this work. But great coaches are rare, expensive, and hard to vet, and most of the people lifting in garage gyms and corporate gyms and basement bars are never going to find one. AI did not beat the great coach. It made expert-level programming available to the lifter who was never going to find one. That is what democratized expertise actually means: not the death of the coach, but the end of the gatekeeping.

We love to see the numbers go up, that is why we lift. The dynamic, expert-led program is what makes them go up, and AI just put it in everyone's pocket. The lifter who plateaued for three years following a ten-year-old PDF can now run a program that actually responds to them. The dad training in his garage at 5 a.m. between school runs gets feedback he would never have paid for in cash. The fifty-year-old coming back from injury gets a return-to-load curve that no textbook would have written for their body. The floor of the work just got higher, and the ceiling is still where it has always been, as far as you are willing to grind for it.

Here is what AI does not change. The bar still bends under load. The night before a heavy set still keeps you up, and the platform still asks the question it has always asked: *what do you actually have, today?* AI cannot answer that for you. It can only set the stage, and the lift is still yours.

Give a shit is the working motto of my career, the one I traced in the prologue and Chapter 1 from VMM-364 through Nate Fick, and AI does not give a shit. That part has not changed and will not. Hitting depth still requires you to give a shit. The PR still requires you to want it, and the grind still requires you to feel it. AI is the program. Giving a shit is the lifter.

So if you are using AI to train, three things are now your job and only yours, three forms of giving a shit under the bar.

Show up. Every day, even when the spark fades, and especially then.

Tell the truth. To the app, to your training log, and most of all to yourself. Two reps in reserve means two, not one and a maybe.

Own the lift. The program did not squat the weight. You did, so the PR is yours, the miss is yours, and the progress is yours.

That is the trade AI offers under the bar: a smarter program, in exchange for a lifter who still gives a shit. It is the best deal strength training has ever seen, but only if you take it seriously.

AI IN THE BOARDROOM

CHAPTER 13 · SECTION 13.2

I run product with Claude as a teammate. It reads my epics and asks me what I missed. It builds wireframes from a written brief in minutes, summarizes a competitor's last six press releases before my coffee is cold, and drafts sections of a roadmap I would have spent an evening on. It is the closest thing to a senior editor and a junior designer and a research analyst in your pocket that has ever existed, and it does not feel what the user feels.

That is the seam in this whole conversation. The discourse around AI in product management has been quick to declare the role obsolete. Engineers can prompt their way to an epic, AI can summarize a customer call, and anyone with the right tools can ship a working prototype before lunch. The argument goes: if all of that is true, what does the PM still do?

Robotic is already the word we use when a person responds without empathy. *"That answer was robotic."* *"Don't be so robotic with the customer."* It is not a compliment when we apply it to a human, so why would it be the goal for how products get built? We do not want robots building experiences. We need empathy, we need relation, and we need a human.

That motto, *give a shit*, is the line. A model can render empathy convincingly and mimic the language of caring, but it cannot live it and it cannot actually care. The Purple Foxes flew into enemy fire because someone on the other end was bleeding. That is not a workflow or a prompt. That is what humans do for other humans when nothing else will do, it is also what product work at its best is, and it is the part AI is not crossing.

The whole system runs on one input here too: presence. Did you actually sit with the user, or did you let AI summarize the call? Did

you watch them try the workflow, or did you ask the model what frustrated them? Did you carry their problem home with you, or did you tag the recording and move on?

AI cannot guess, it can only respond to what you give it. Give it your assumptions and it gives back a confidently written version of your assumptions. Give it a real problem you have actually witnessed and it gives back something worth building on. The difference between a PM who is good with AI and one who is great is whether they have actually been in the room. That is the trade, same as under the bar: AI gives you a teammate, and you give AI your time with the user.

I believe the same thing here as under the bar: AI does not replace the PM so much as it exposes the people who were never doing the empathetic work in the first place.

Melissa Perri, who has trained more product leaders than almost anyone in the field, frames it cleanly: *AI excels at the how. You own the why.* That is the right line. AI is a stunningly good *how* engine. Specs, drafts, competitive scans, design variations, prototype builds, and edge-case enumeration all come out faster, cheaper, and more thorough than what a human alone produced two years ago. But the *why* has not moved. The user, the mission, the right problem to solve in the first place: that is still a question only a human in the room with another human can answer.

This is also why the LinkedIn experiment is worth taking seriously. Tomer Cohen, LinkedIn's Chief Product Officer, has been replacing traditional PM roles with what he calls *Full Stack Builders*, generalists who design, prompt, prototype, and ship end to end with AI rather than handing off across functions. The structural argument is sound. The role boundary is doing less work than it used to, and I do not disagree with Cohen on the mechanics.

But the question is not whether you call the role PM or full-stack builder. The question is whether the person doing the work can

feel what the user feels. A full-stack builder who can do that is a product creator, and one who cannot is shipping faster mediocrity in a smaller org chart. The title is downstream of the empathy.

Marty Cagan has made this point for years, and AI made it urgent. The title PM is not protected, the work of *product creation* is. People in product manager roles who never developed product sense are vulnerable, and people in any role who can sit with a user, name the real problem, and own the outcome are the ones who matter. AI raised the floor on execution, not on judgment.

The PM's epic is changing because of this. A great epic in 2026 should be readable to AI. It should explain the problem clearly enough that an AI editor can ask sharp questions back, describe the experience cleanly enough that an AI prototyper can wire a working version, and position competitively in language an AI strategist can stress-test. The best PMs I work with use that as their bar. If I uploaded this epic to Claude, would the AI understand the problem? Would it know what experience solves it? Would it know what competitors are doing nearby? When the answer is yes, you have written a real epic. When the answer is no, you have written a paragraph that hides what you do not yet understand.

There is a catch, though. Pawel Brodzinski, who writes about this more clearly than most, names a structural truth the discourse keeps missing: AI by definition pulls toward the median. The model produces what the data's center of gravity says is most likely, and creativity lives at the fringes of the distribution. So an AI-generated epic is by definition a median epic: confident, clean, and average. The PM's job is to be the deviation that finds the actual user insight the median was never going to surface. AI gives you a faster median, and the human is the difference between median and meaningful.

What AI gives the PM in 2026 is access. The PM at a five-person startup can produce at the pace of a PM at Stripe. The PM with three product surfaces can keep up with all three, and the new PM ships in their first month at a level that used to take a year to learn. The floor of the work just got higher here too, and the ceiling has not moved an inch: it is still as far as you are willing to sit with a user and care about their problem.

Here is what AI does not change. The customer still wants someone who sees them. The engineering team still needs a clear *why*, the roadmap still has to make a choice, and the launch still has to be owned. The user still wants to know there is a human on the other side of the product who took their mission seriously. AI cannot do that part, it can only set the stage.

So if you are running product with AI, three things are now your job and only yours, the same three forms of giving a shit, in the boardroom.

Show up. In the room with the user, not the transcript, and on the call, not in the summary. AI cannot replace your time. It can only multiply it.

Tell the truth. About what you actually know versus what you assumed, about what the data says versus what your gut says when they conflict, and about what your team can ship versus what AI made look easy.

Own the outcome. You signed off on it, so you own it. The most dangerous line in any review meeting, the one I named in Chapter 12, is “*the AI did it.*” The agent did not write the spec alone and the model did not pick the customer to ship to. AI is a teammate, and like any teammate it can let you down, but the responsibility to finish does not transfer.

That is the trade AI offers in the boardroom: a faster team, in exchange for a PM who still gives a shit. It is the best deal product management has ever seen. The catch is that the deal is only good for someone who can still feel what the user feels, who still carries

their problem home, and who still wants to be the human they meet on the other side of the product. Stay that person and AI makes you better at the job. Lose that person and AI just helps you ship faster to people you stopped seeing.

Those are two halves of one argument. AI raised the floor of training under the bar and the floor of execution in the boardroom. In neither case did it raise the ceiling of the work that matters. The lift is still yours, the user is still theirs, and the mission is still the only thing worth running on top of any of it.

There is a metaphor from my published work that belongs here. AI is the Iron Man suit. The suit makes you faster, stronger, and harder to kill, but it does not tell you what is worth fighting for, or who you are fighting for, or when to take the suit off and look someone in the eye. The human inside the suit is still the only one who can answer those questions. The suit changed everything about the work. The mission inside the suit did not move at all.

The second metaphor, also from my published work, names what is structurally happening: AI is the new operating system. The interface layer is shifting from applications to AI environments, and the conversation is becoming the workspace. Everything that used to be an app, your dashboard, your roadmap tool, your customer interview, your training log, is becoming an app inside an AI environment that stitches them together. That is real, and it is also incomplete.

An operating system on its own runs nothing. It needs an app, and there is one app AI cannot build, ship, debug, or maintain on its own: the mission, the decision about who you are building for, and why, and what you owe them. That decision belongs to a human. It always has, and it still does.

AI is the new OS.

The mission is the only app that matters.

And the only thing that runs the app is a person who gives a shit.

That is the argument of this chapter, and of the year I added it. The Drift will show up here too. We named it three times in this book: mission overridden by metric in Chapter 1, sprinting without recovery in Chapter 6, and the legacy-shaped Drift in Chapter 12. The AI-shaped Drift, the fourth one we have now lived with long enough to see clearly, looks like a team that has stopped asking *why* because the *how* has become so frictionless. Why interview the user when AI summarized their last call? Why agonize over the brief when AI will refine it? Why slow down to feel the user's problem when AI can render it for you in plausible English? That is the Drift in its 2026 shape, the same shape as the other three, with the same antidote: the mission, the user, and the motto.

Give a shit. About the work. About the people. About the outcome. That is the only app that matters.

Now go run it.

III CONCLUSION

14

**CONCLUSION: GIVING A
SHIT WORKS**

At every stage of my life, whether wearing a uniform, defending networks, lying under a barbell, or building a product, I kept running into the same lesson: giving a shit works.

We've already talked about those nights advocating for air assets while serving as an intelligence analyst overseas, when the real challenge wasn't the data but the conversations, the negotiations, and the weight of knowing that if I couldn't make the case clearly, people downrange might not get the support they needed. Giving a shit wasn't optional. It was the difference between letting things happen and fighting for what mattered most.

I saw the same pattern later as a SOC analyst and lead defending some of the largest government networks in the world. The best defenders weren't always the smartest or the fastest. They were the ones who gave a shit enough to search for the serendipitous connections between events that looked like they had nothing to do with each other, the deep analyses that found attacks in time to stop damage and loss to critical systems. The analysts with empathy for their teammates, respect for users, and pride in their work were the ones who set the tone.

When I moved into product management, giving a shit meant obsessing over the details of problems I'd lived myself: how slow alert triage wasted defenders' time, or how confusing interfaces kept critical data hidden. At Endgame, in a mature, crowded EDR market, our willingness to listen to defenders, to give a shit about their realities, helped us build a product recognized as a Visionary by Gartner. When Endgame was acquired by Elastic, giving a shit meant betting on the users again: launching Elastic SIEM, building the Elastic Security division from the ground up, and in just a few years earning recognition from Gartner and Forrester as one of the leaders in a fiercely competitive SIEM space. But more important than any analyst recognition was the validation from our users, the real stories of success, attacks mitigated, remediation accelerated, and defenders delighted. That was the true measure of whether we gave a shit enough.

Under the barbell, giving a shit took a different shape. It meant tracking tiny progress when nothing felt like it was changing, resting on days when my ego screamed to push harder, and spotting a training partner with the same care you'd want from them. It meant seeing that strength isn't just what you can lift, but how you show up for others, because real strength lifts others.

And then came the year I finished writing this book, which was also the year I had to add a chapter. The chapter you just read names what AI changed and what it didn't, and I won't relitigate the argument here. I'll just say it once more, in the place this book has always been heading: real strength is the part AI cannot do, and the mission is what only a human can run. The motto still works, maybe more than ever.

That's the lesson I want you to carry with you from this book: giving a shit works. It will cost you something, in time, energy, and vulnerability. But what you get in return is better than any shortcut: teams who trust you, skills that endure, a mission that matters, and a life of meaning.

So don't let cynicism, busyness, or ego keep you from caring deeply, and don't confuse kindness for weakness, or empathy and compromise for giving in. In a time when the world seems to be forgetting our shared humanity, be the bastion of integrity. Be the one who shows heart. Care enough to show up, to do the hard reps, to listen, to adapt, and to lift the people around you. Give a shit. About the work. About your mission. And most importantly, about others. When you do, you'll build something stronger than you ever thought possible.

Now go build it.

SOURCES

Curated citations supporting specific claims, quotes, statistics, and named events in the manuscript. URL freshness verified as of May 2026 against the WebSearch index. Where v1.13 URLs have been superseded, the new canonical URL is used here.

Citation philosophy: a source belongs in the book if it backs something a reader might want to verify — a quoted line, a stat, a specific event, a named person's published view. Sources used as general "see also" reading have been cut.

CHAPTER 1 — MISSION BEFORE METRICS

Nathaniel Fick — *One Bullet Away: The Making of a Marine Officer* Houghton Mifflin Harcourt, 2005. ISBN 978-0-618-77343-5. https://en.wikipedia.org/wiki/One_Bullet_Away_Memoir by Nate Fick — the leader Mike worked alongside at Endgame and the source of the "give a shit" motto's transmission into the book. Cited from Ch 1 (where Nate is introduced as the Endgame CEO and Marine Recon officer) and Ch 8 (where Fick is quoted directly: "Complex ideas must be made simple, or they'll remain ideas and never be put into action"). The book establishes Fick's lineage from Dartmouth student to Recon Marine officer leading combat missions in Afghanistan and Iraq, which the book references.

Cyberpunk 2077 launch and stock crash Forbes, Paul Tassi: "CDPR Stock Drops After Buggy, Messy Cyberpunk 2077 Launch." <https://www.forbes.com/sites/paultassi/2020/12/18/cdpr-stock-drops-after-buggy-messy-cyberpunk-2077-launch/> Backs the launch failure, the millions in refunds, and the stock crash referenced in the chapter. Forbes contributor URLs occasionally delist; if so, replace with TechSpot's coverage of the same event.

Humane AI Pin failure (v2 addition) TechCrunch: "Humane's AI Pin is dead, as HP buys startup's assets for \$116M." <https://techcrunch.com/2025/02/18/humanes-ai-pin-is-dead-as-hp-buys-startups-assets-for-116m/> Backs the \$116M acquisition, the asset transfer, and the device-bricking event. For the launch pricing and total raised: https://en.wikipedia.org/wiki/Humane_Inc.

Marques Brownlee Humane AI Pin review YouTube, MKBHD: "The Worst Product I've Ever Reviewed... For Now." <https://www.youtube.com/watch?v=TitZV6k8zfA> Direct source for the review framing.

Boeing 737 MAX original crashes Wikipedia: *Boeing 737 MAX groundings*. https://en.wikipedia.org/wiki/Boeing_737_MAX_groundings Comprehensive overview of the two crashes, MCAS failure, and corporate safety culture. NYT URL from v1.13 is paywalled; Wikipedia is the more durable cite.

Boeing Alaska Airlines flight 1282 (v2 addition) Wikipedia: *Alaska Airlines Flight 1282*. https://en.wikipedia.org/wiki/Alaska_Airlines_Flight_1282

Documents the January 5, 2024 door plug blowout, the missing four bolts, and the NTSB findings. For the regulator's primary source on systemic causes: <https://www.nts.gov/news/press-releases/Pages/NR20250624.aspx>

Hafthor Björnsson pec tear EssentiallySports: Hafthor's "biggest mistake" reflection on his pec injury. <https://www.essentiallysports.com/bodybuilding-news-probably-my-biggest-mistake-months-after-a-horrifying-pec-tear-while-bench-pressing-strongman-legend-makes-a-candid-confession-about-his-injury-hafthor-bjornsson/> Backs the 556-pound bench press, the pec tear, and Hafthor's quote about not recovering between sessions.

Simone Biles 2021 Olympics withdrawal Wikipedia: *Simone Biles* (mental health withdrawal section). https://en.wikipedia.org/wiki/Simone_Biles Backs the Tokyo 2020 withdrawal and Biles's mental health framing. The People.com URL from v1.13 is hard to verify via search; Wikipedia is the durable cite for the event itself.

Patagonia "Don't Buy This Jacket" campaign Patagonia: *"Don't Buy This Jacket: Black Friday and the New York Times."* <https://www.patagonia.com/stories/dont-buy-this-jacket-black-friday-and-the-new-york-times/story-18615.html> Primary source for the campaign.

Mission-driven employee retention (54% / 52% statistics) HBR (sponsored by EY): *"The Business Case for Purpose."* <https://hbr.org/sponsored/2016/04/the-business-case-for-purpose> Original research backing the retention claims used in the chapter.

OODA Loop Wikipedia: *OODA loop*. https://en.wikipedia.org/wiki/OODA_loop Backs the framework and its origin in fighter pilot training.

Stefi Cohen's training methodology Hybrid Performance Method. <https://www.hybridperformancemethod.com/blog/are-isolation-movements-better-for-muscle-growth> Backs the hybrid block-training approach attributed to her. Used across Ch 1, 4, and 5; cite once.

Atlassian ShipIt (hack week) Atlassian: *ShipIt*. <https://www.atlassian.com/company/shipit> Backs the hack-week ritual reference. Updated path; v1.13's `/team-playbook/plays/shipit` was moved to `/company/shipit`.

CHAPTER 2 — BUILT THROUGH REPS

Instagram's pivot from Burbn Wikipedia: *No Filter: The Inside Story of Instagram* (Sarah Frier). https://en.wikipedia.org/wiki/No_Filter:_The_Inside_Story_of_Instagram Backs the Burbn-to-Instagram pivot referenced in the chapter.

Steve Jobs faked the iPhone keynote New York Magazine, *Intelligencer*: *"How Steve Jobs Faked His Way Through Unveiling the iPhone."* <https://nymag.com/intelligencer/2023/01/how-steve-jobs-faked-the-iphone-keynote.html> Backs the

“polish hides process” claim. If the URL becomes inaccessible, the AppleInsider behind-the-scenes piece is a viable replacement.

James Clear quote (“you fall to the level of your systems”) James Clear: *Atomic Habits* page. <https://jamesclear.com/atomic-habits> Direct attribution for the quoted line.

Renaissance Periodization training volume framework (MV/MEV/MAV/MRV) Renaissance Periodization: “How Much Should You Train?” <https://renaissanceperiodization.com/expert-advice/how-much-should-you-train/> Source for Dr. Mike Israetel’s volume framework. (Note: RP rebranded to rpstrength.com — the renaissanceperiodization.com URL still resolves but the canonical URL going forward is <https://rpstrength.com/expert-advice/training-volume-landmarks-muscle-growth/>.)

Frans Johansson, *The Medici Effect* Frans Johansson: official site (books page). <https://www.fransjohansson.com/books> Direct source for the quoted Medici Effect framing.

Cursor / Anysphere — second-product pivot (v2 addition) Cursor official site. <https://www.cursor.com/> Backs the Cursor reference in *Myth of Overnight Success*. For the Anysphere pivot history (originally a different product before becoming the AI IDE), see TechCrunch coverage of their 2024 funding rounds: <https://techcrunch.com/2024/12/19/in-just-3-months-ai-coding-assistant-cursor-raised-another-100m-at-a-2-5b-valuation-led-by-thrive-sources-say/> — the “two years of pivoting” claim is documented in Anysphere founder interviews.

CHAPTER 3 — RITUALS OVER RULES

Ken Norton on saying no as a product leader Ken Norton (now hosted at Bring the Donuts): “*The Discipline of No.*” <https://www.bringthedonuts.com/essays/discipline-of-no.html> Backs the PM-as-shield framing. Original kennorton.com domain has been retired.

Game industry crunch culture Wired: “*Inside Rockstar Games’ Culture of Crunch.*” <https://www.wired.com/story/rockstar-red-dead-redemption-2-crunch-time/> Backs the crunch-as-failure-signal framing in the chapter.

Linear’s Cycles framework (v2 addition) Linear: *Method*. <https://linear.app/method> Backs the Linear cycles / async-first / scope-cutting reference in *Change the Pattern, Not the Practice*. Companion: <https://linear.app/method/cycles> for the cycle structure specifically.

CHAPTER 4 — FEEDBACK IS A SUPERPOWER

Slack's origin in the Glitch internal tool Wired: profile of Stewart Butterfield and the Tiny Speck pivot. <https://www.wired.com/2014/08/the-most-fascinating-profile-youll-ever-read-about-a-guy-and-his-boring-startup> Backs the Glitch / Tiny Speck / Slack origin story.

Stefi Cohen “Knees out” cue Hybrid Performance Method (same source as Ch 1; cite once.)

Marty Cagan on PMs talking to users SVPG: “Discovery Feedback.” <https://www.svpbg.com/discovery-feedback> Backs the “if you're not talking to users, you are failing” assertion.

Target Canada collapse Canadian Business: “The Last Days of Target Canada.” <https://canadianbusiness.com/ideas/the-last-days-of-target-canada/> Backs the operational-failure-by-ignored-signals story.

Fitbit sleep score and user anxiety Washington Post: feature on sleep wellness, Oura, and Fitbit. <https://www.washingtonpost.com/business/2020/02/14/sleep-wellness-employer-oura/> Backs the metrics-misinterpreted-as-truth claim. (Paywall risk; flag for proof-stage check.)

Figma's culture of real-time feedback Figma blog: “Inside Figma: Building a More Collaborative Design Process.” <https://www.figma.com/blog/inside-figma-building-a-more-collaborative-design-process/>

Duolingo's micro-feedback design Duolingo blog: “Duologues: Design Conversations.” <https://blog.duolingo.com/duologues-design-conversations/>

Dovetail AI for research synthesis (v2 addition) Dovetail: AI features overview. <https://dovetail.com/ai/> Backs the Dovetail reference in *Make Feedback a Ritual*. Dovetail's Magic Summaries, Channels, and Insight Boards are the specific products the passage references. Companion: <https://dovetail.com/blog/> for product-team workflow examples.

CHAPTER 5 — PROGRESS ISN'T PRETTY

Malcolm Gladwell's 10,000-Hour Rule The New Yorker, Gladwell: “Late Bloomers.” <https://www.newyorker.com/magazine/2008/10/20/late-bloomers-malcolm-gladwell> Source for the 10K-hour concept attributed to Gladwell.

Chad Wesley Smith / Juggernaut Training Systems JTS Strength: official site. <https://www.jtsstrength.com> Backs the JTS attribution and the periodization framing.

JuggernautAI app JuggernautAI: official site. <https://www.juggernautai.app> Direct source for the AI-driven training app the author uses.

Elastic Security's iterative SIEM build Elastic: “Introducing Elastic SIEM” (2019 launch announcement). <https://www.elastic.co/blog/introducing-elastic-siem>

Backs the Elastic Security launch arc referenced in the chapter.

CrowdStrike global outage (2024) The Guardian: “*CrowdStrike outage: Microsoft apology.*” <https://www.theguardian.com/technology/2024/sep/24/crowdstrike-outage-microsoft-apology> Backs the 2024 outage reference. (Paywall risk; flag for proof.)

Anthropic’s Claude release cadence (v2 addition) Anthropic: *News*. <https://www.anthropic.com/news> Backs the disciplined-iteration parallel: Claude 3 → 3.5 → 4 → 4.5 → Opus 4.6 release cadence with public changelogs. The chronology is documented across Anthropic’s news posts.

CHAPTER 6 — THE MISSION DEMANDS RECOVERY

Mat Fraser on disciplined recovery YouTube interview clip: Mat Fraser on “doing the boring stuff.” <https://www.youtube.com/watch?v=TLU-Qy0Ireg> Direct source for the quoted line.

Basecamp’s Shape Up / six-week + two-week cycle Basecamp: *Shape Up*. <https://basecamp.com/shapeup> Backs the 6/2 cycle attribution.

NASA Challenger disaster NASA / Rogers Commission Report (PDF). https://sma.nasa.gov/SignificantIncidents/assets/rogers_commission_report.pdf Primary source for the inability-to-pause framing.

Evernote’s drift and decline TechCrunch: “*Evernote lost its CTO, CFO, CPO, and HR head...*” <https://techcrunch.com/2018/09/04/evernote-lost-its-cto-cfo-cpo-and-hr-head-in-the-last-month-as-it-eyes-another-fundraise/> Backs the Evernote feature-sprawl-and-leadership-turnover story used as the recovery-shaped Drift example.

Netflix Keeper Test and culture deck Netflix Culture Deck (Reed Hastings on SlideShare). <https://www.slideshare.net/reed2001/culture-1798664> Backs the Keeper Test framing.

Atlassian Team Health Monitors Atlassian: *Health Monitor* page in the Team Playbook. <https://www.atlassian.com/team-playbook/health-monitor> Direct source for the Team Health Monitor structure.

Apple iPhone 4 antenna issue (“you’re holding it wrong”) Wikipedia: *Antennagate*. <https://en.wikipedia.org/wiki/Antennagate> Backs the iPhone 4 reception failure and Apple’s response.

CHAPTER 7 — TRAIN THE ENGINE, NOT JUST THE OUTPUT

General Physical Preparedness (GPP) CrossFit: *General Physical Preparedness*. <https://www.crossfit.com/sport/general-physical-preparedness> Backs the GPP

concept used to frame work capacity. Updated path; v1.13's /essentials/ was moved to /sport/.

Notion's 18-month editor rebuild First Round Review: *"Inside Notion: How One of Today's Most Beloved Apps Came to Be."* <https://review.firstround.com/inside-notion-how-one-of-todays-most-beloved-apps-came-to-be/> Primary-source-quality account of the 2015 near-death rebuild — two engineers, no releases for 18 months, Ivan Zhao and Simon Last in Kyoto rebuilding the editor from scratch. Stronger cite than the Notion blog landing.

Superhuman's product-market fit framework First Round Review: *"How Superhuman Built an Engine to Find Product-Market Fit."* <https://review.firstround.com/how-superhuman-built-an-engine-to-find-product-market-fit> Backs the Rahul Vohra "very disappointed" launch metric attribution.

SERE training (Survival, Evasion, Resistance, Escape) Wikipedia: *SERE*. https://en.wikipedia.org/wiki/Survival,_Evasion,_Resistance_and_Escape Backs the SERE program reference.

CHAPTER 8 — DECISIONS ARE MADE UNDER LOAD

Log4j vulnerability response (Elastic) Elastic: *"Log4j2 vulnerability: what to know and how Elastic supports you."* <https://www.elastic.co/blog/log4j2-vulnerability-what-to-know-security-vulnerability-learn-more-elastic-support> Backs the Log4j response framing in the chapter.

Netflix Chaos Monkey Netflix Tech Blog: *"The Netflix Simian Army."* <https://medium.com/netflix-techblog/the-netflix-simian-army-16e57fbab116> Direct source for the Chaos Monkey origin and the 80%-prevented-outages framing.

Change Healthcare ransomware attack (February 2024) (v2 addition) Wikipedia: *Change Healthcare ransomware attack*. https://en.wikipedia.org/wiki/Change_Healthcare_ransomware_attack Backs the 2024 stress-test pairing with Log4j. Documents the BlackCat/ALPHV ransomware attack, the months-long disruption to claims processing and prescription routing, and the ~\$2.45 billion impact. Companion primary source: HHS Secretary Becerra's congressional testimony — <https://www.hhs.gov/about/news/2024/05/01/hhs-statement-regarding-the-cyberattack-on-change-healthcare.html>

Nathaniel Fick, One Bullet Away — quoted See full citation in Chapter 1. *"Complex ideas must be made simple, or they'll remain ideas and never be put into action."*

John Boyd OODA Loop (cross-reference Ch 1) See Ch 1 citation; not duplicated here.

The 2026 stress-test stats (machine-speed attacks)

These statistics anchor the new AI section in this chapter. All sourced from primary threat-intelligence reports. Cite by primary publisher:

- **Microsoft Digital Defense Report 2025** — <https://www.microsoft.com/en-us/security/security-insider/threat-landscape/microsoft-digital-defense-report-2025> (Source for the 4.5x phishing click-through rate.)
 - **CrowdStrike 2025 Global Threat Report (PDF)** — <https://go.crowdstrike.com/rs/281-OBQ-266/images/CrowdStrikeGlobalThreatReport2025.pdf> (Source for the 27-second breakout time.)
 - **SANS / CSA Zero Day Clock** — <https://zerodayclock.com/collapse> (Source for the 2.3-years-to-under-one-day exploitation window.)
-

CHAPTER 9 — SHIP IT LIKE YOU SHOW UP

Lu Xiaojun's integrated lifting style Lu Xiaojun official blog: “*The Legacy of Lu Xiaojun.*” <https://luxiaojun.com/blogs/blogs/the-legacy-of-lu-xiaojun-from-champion-to-icon> Backs the Lu Xiaojun integration-as-mastery framing.

GitHub Project Paper Cuts GitHub blog: “*Introducing Project Paper Cuts.*” <https://github.blog/news-insights/product-news/announcing-paper-cuts/> Backs the engineering-as-friction-removal framing.

Great Ormond Street Hospital + Ferrari F1 pit crew ASQ case study: “*Great Ormond Street Hospital for Children: Ferrari’s Formula One Handovers.*” <https://asq.org/quality-resources/articles/case-studies/great-ormond-street-hospital-for-children-ferraris-formula-one-handovers-and-handovers-from-surgery-to-intensive-care?id=fbc699af11d04980ade06f409a5d6f98> Primary case study for the cross-domain integration story. The most-quoted external source in the book; verify carefully at proof.

Mr. Rogers and empathic listening Greater Good (UC Berkeley): “*Seven Lessons from Mister Rogers That Can Help Americans Be Neighbors Again.*” https://greatergood.berkeley.edu/article/item/seven_lessons_from_mister_rogers_that_can_help_americans_be_neighbors_again Backs the Mr. Rogers framing as a model of empathy as design discipline.

Red Flag exercise at Nellis Air Force Base (v2 addition) Wikipedia: *Exercise Red Flag*. https://en.wikipedia.org/wiki/Exercise_Red_Flag Backs the Red Flag exercise context for the Endgame deployment story.

U.S. Marine Corps “Slow is smooth, smooth is fast” Reference cite — common Marine Corps adage; no single primary URL. If a citation is needed, USMC publications carry the phrase widely.

CHAPTER 10 — THE TEAM IS THE TOOL

Patrick Lencioni, *The Five Dysfunctions of a Team* Wikipedia: *The Five Dysfunctions of a Team*. https://en.wikipedia.org/wiki/The_Five_Dysfunctions_of_a_Team

HBR on psychological safety Harvard Business Review: “*High-Performing Teams Need Psychological Safety. Here’s How to Create It.*” <https://hbr.org/2017/08/high-performing-teams-need-psychological-safety-heres-how-to-create-it>

Jim Collins, *Level 5 Leadership* Harvard Business Review: “*Level 5 Leadership: The Triumph of Humility and Fierce Resolve.*” <https://hbr.org/2001/01/level-5-leadership-the-triumph-of-humility-and-fierce-resolve-2> Note the trailing -2 in the slug — required for the canonical HBR URL.

Doris Kearns Goodwin, *Team of Rivals* Wikipedia: *Team of Rivals*. https://en.wikipedia.org/wiki/Team_of_Rivals

Kim Scott, *Radical Candor* First Round Review: “*Radical Candor: The Surprising Secret to Being a Good Boss.*” <https://review.firstround.com/radical-candor-the-surprising-secret-to-being-a-good-boss>

WeWork / Adam Neumann collapse Vanity Fair: “*Inside the Fall of WeWork.*” <https://www.vanityfair.com/news/2019/11/inside-the-fall-of-wework> (Paywall risk; flag for proof.)

CHAPTER 11 — STRONG ENOUGH TO LISTEN

Alan Mulally’s Ford turnaround C-Suite Strategy: “*Leadership Lessons from Alan Mulally — Transforming Company Strategy.*” <https://www.c-suite-strategy.com/blog/leadership-lessons-from-alan-mulally-transforming-company-strategy> Backs the Business Plan Review and green/yellow/red culture story.

Marshall Goldsmith, *What Got You Here Won’t Get You There* James Clear book summary. <https://jamesclear.com/book-summaries/what-got-you-here-wont-get-you-there>

Founder’s Dilemma (Harvard Business Review) HBR: “*The Founder’s Dilemma.*” <https://hbr.org/2008/02/the-founders-dilemma>

Stephen R. Covey on listening Source: *The 7 Habits of Highly Effective People*. Quote attribution only — no specific URL needed for the well-established Covey citation.

CHAPTER 12 — THE WEIGHT IS REAL. OWN IT.

Air Canada chatbot tribunal ruling (February 2024) (v2 addition) BBC: “Air Canada must honour refund policy invented by chatbot.” <https://www.bbc.com/travel/article/20240222-air-canada-chatbot-misinformation-what-travellers-should-know> Backs the Air Canada chatbot ruling cited in *When the Agent Did the Work, You Still Own It*. Documents the bereavement-fare misinformation, Air Canada’s “separate legal entity” defense, and the British Columbia Civil Resolution Tribunal ruling against the airline. Primary source: <https://decisions.civilresolutionbc.ca/crt/sc/en/525448/1/document.do> (Moffatt v. Air Canada, 2024 BCCRT 149).

CHAPTER 13 — AI IS THE NEW OS. THE MISSION IS THE ONLY APP THAT MATTERS.

VMM-364 “Purple Foxes” — the Marine squadron motto (v2 addition) 3rd Marine Aircraft Wing: *Marine Medium Tiltrotor Squadron 364*. <https://www.3rdmaw.marines.mil/Units/MAG-39/VMM-364/> Primary source for the squadron’s CASEVAC mission and the “Give a Shit” motto on the squadron patch. Cited from this chapter, the Prologue, and Ch 1.

Mike Nichols on the agentic SOC Elastic Blog: “The AI arms race in cybersecurity: Why your SOC needs to evolve now.” <https://www.elastic.co/blog/ai-cybersecurity-arms-race-agentic-soc> Author’s own published piece. Source for the “if you are not using AI to battle AI, you will lose” position, the Iron Man suit metaphor, the autonomous-SOC fantasy critique, and the pyramid-to-diamond shift.

Mike Nichols on AI as the new operating system LinkedIn Pulse: “AI is the New OS. Everything Else is an App.” <https://www.linkedin.com/pulse/ai-new-os-everything-else-app-h-michael-nichols-ii7be/> Author’s own published piece. Source for the “AI is the new OS” spine, the “from answers to action” framing, and the conversation-becomes-the-workspace argument.

Marty Cagan on the era of the product creator SVPG: “The Era of the Product Creator.” <https://www.svpg.com/the-era-of-the-product-creator/> Source for the product-creator-vs-process-value framing.

Marty Cagan on AI in product management SVPG: “AI Product Management: 2 Years In” (May 2025). <https://www.svpg.com/ai-product-management-2-years-in/> Companion source for the Cagan position cited in the chapter.

Melissa Perri on AI and product strategy Liveblocks (interview with Perri): “Rethinking product strategy in the age of AI.” <https://liveblocks.io/blog/rethinking-product-strategy-in-the-age-of-ai> Source for the paraphrased “AI excels at the how — you own the why” framing attributed to Perri in the chapter.

Tomer Cohen / LinkedIn on “Full-Stack Builders” Lenny’s Newsletter: “Why LinkedIn is replacing PMs with AI-powered full-stack builders.” <https://www.lennys>

newsletter.com/p/why-linkedin-is-replacing-pms Source for the LinkedIn experiment cited in the chapter.

Pawel Brodzinski on AI and median ideas Pawel Brodzinski: “AI Won’t Generate a Good Product Idea.” <https://pawelbrodzinski.substack.com/p/ai-wont-generate-a-good-product-idea> Source for the AI-pulls-toward-the-median structural argument.

NOTES ON THIS CURATED LIST

What was cut from v1.13’s Further Reading. Roughly 50 entries that served as background reading rather than backing specific claims: multiple HBR articles on adjacent topics, books mentioned but not quoted (Atomic Habits stays because Clear is quoted directly; Compound Effect, Grit, Why We Sleep, Rest were cut — they’re recommended reading, not load-bearing citations), academic papers cited as “see also,” and several duplicative sources for the same event.

What was added. 16 v2 sources for the Humane AI Pin failure, Boeing Alaska 1282, the AI chapter (VMM-364, Mike’s two own pieces, Cagan/Perri/Cohen/Brodzinski), the Red Flag exercise, the iPhone 4 antennagate reference, Atlassian Team Health Monitor, SERE training, Antennagate.

What stayed BLOCKED but was kept. A few paywalled sources (Vanity Fair WeWork, Washington Post Fitbit, Forbes Cyberpunk, Guardian CrowdStrike outage). These are the strongest sources for their respective claims and removing them would weaken the citation. They should be hand-clicked at proof, with a note for the printer about paywall accessibility.

Mike’s two confirmations applied: – LinkedIn Pulse “AI is the New OS” URL retained per Mike’s confirmation. – Melissa Perri quote paraphrased; chapter citation now points to the Liveblocks interview as the supporting source.

Total entries: 63 (vs. 101 in the previous comprehensive verification doc, vs. ~84 in v1.13’s Further Reading). Each entry backs a specific load-bearing claim in the manuscript. The six new additions (Cursor, Linear’s Cycles, Dovetail, Anthropic, Change Healthcare, Air Canada chatbot) cite the v2 example pairings added during Section 2.2 of the punch-list round. Nate Fick’s *One Bullet Away* is now fully cited in Ch 1 with bibliographic detail, with a back-reference in Ch 8 for the quoted line.

ABOUT THE AUTHOR

Mike Nichols builds products and lifts heavy things, both in service of something bigger than himself.

He began his journey as an Airborne intelligence sergeant in the U.S. Army, where he learned the value of discipline, clarity under pressure, and showing up for the team. Those lessons carried into civilian life, where he spent over two decades in cybersecurity, from SOC analyst to product leader to General Manager of Elastic Security, helping teams ship tools that protect people and infrastructure around the world.

But this book isn't about titles or timelines. It's about the patterns that repeat across every meaningful pursuit: showing up when it's hard, lifting others when you can, and staying true to the mission even when no one's watching.

Mike trains in a garage gym, leads Elastic Security, raises incredible kids, and does his best to live what he writes, imperfectly but with intention. The second edition adds a chapter for the year AI changed how we build.

You can find him at missionbuilt.io, where this work continues, one rep at a time.

ACKNOWLEDGMENTS

This book, like any mission worth building, wasn't accomplished alone.

To my beyond: thank you for seeing me, not just in the spotlight but in the shadows, and for standing beside me in the chaos and the quiet. You are the home I never have to return from, because you are with me in every rep, every word, every breath of this mission.

To my kids: you remind me that strength isn't just power but presence, patience, and persistence. I hope you see yourselves in these pages one day and know that everything I build, I build with you in mind.

To Nate Fick: you carried something out of uniform that I have spent my career trying to be worthy of. The motto, the elevator-asset framing, the Marine Recon ethos translated into how to lead a tech team: these are not abstractions to me. They are the standard. And through Nate, to every veteran whose service and sacrifice form the blueprint for what it means to show up with integrity: this book is a tribute to the discipline we carry forward.

To the teams at Endgame and Elastic, and to every engineer, designer, PM, user, and customer who ever cared enough to raise a hand, file a bug, or challenge the roadmap: thank you. You made me better.

To the Mission Built community: your reps, your rituals, and your resilience inspired every chapter. Whether you're building strength under the bar or building trust in a product, your dedication is proof that craft still matters.

And to those quietly doing the hard work every day, refining their process, lifting others, and staying true to the mission: you're already part of this story.

Stay strong. Stay focused. Stay built for more.

EMBRACING THE TOOLS THAT ACCELERATE THE WORK

This book was written by a human, with the help of machines, mentors, and mission-driven design.

Many of the ideas and reflections in *Mission Built* were forged through years of reps in the gym, in product rooms, and in life. Bringing those lessons to the page, and into your hands, was made possible with support from a few remarkable tools:

- **OpenAI's ChatGPT** helped shape the first edition: organizing thoughts, iterating on structure, and editing raw field notes into something more readable, while preserving voice and intent.
- **Anthropic's Claude** served as a senior editorial collaborator on the second edition. Claude Cowork pressure-tested structure, surfaced redundancies, helped draft the new AI chapter, and verified citations across the manuscript. Claude Design carried the visual work: cover, end-matter, and the rebuilt website at missionbuilt.io. For the revised text, Claude ran the whole manuscript against my own voice guide and put back the sentences an earlier edit had flattened.

Every word, story, and metaphor came from real reps and real reflection. Just like good gear and strong teammates, these tools helped bring it all together with more clarity and care.

The ideas are mine. The execution was supported.

– Mike

MISSION BUILT · END

**REAL STRENGTH IS
LIFTING OTHERS.**
